### 1.1 LinearDS - Linear Time Invariant Relations

#### 1.1.1 General notations

We consider  $n$  dynamical systems of the form:

$$\dot{x}_i = A_i x_i + R_i \quad (1.1)$$

Each system is of dimension  $n_i$ , and we denote  $N = \sum_{i=1}^n n_i$ .

An interaction,  $I_\alpha$  is composed with a non smooth law,  $nslaw_\alpha$  and a relation:

$$y_\alpha = C_\alpha X_\alpha + D_\alpha \lambda_\alpha \quad (1.2)$$

The “dimension” of the interaction, ie the size of vector  $y_\alpha$ , is denoted  $m_\alpha$  and we set:

$$M = \sum_{\alpha=1}^m m_\alpha$$

$m$  being the number of interactions in the Non Smooth Dynamical System.

$X_\alpha$  is a vector that represents the DS concerned by the interaction. Its dimension is noted  $N_\alpha$ , this for  $n_\alpha$  systems in the interaction.

$C_\alpha$  is a  $m_\alpha \times N_\alpha$  row-blocks matrix and  $D_\alpha$  a  $m_\alpha \times m_\alpha$  square matrix.

$$C_\alpha = \begin{bmatrix} C_\alpha^i & C_\alpha^j & \dots \end{bmatrix} \quad (1.3)$$

with  $i, j, \dots \in \mathcal{DS}_\alpha$  which is the set of DS belonging to interaction  $\alpha$ .

We also have the following relation:

$$\begin{bmatrix} R_\alpha^i \\ R_\alpha^j \\ \dots \end{bmatrix} = B_\alpha \lambda_\alpha = \begin{bmatrix} B_\alpha^i \\ B_\alpha^j \\ \dots \end{bmatrix} \lambda_\alpha \quad (1.4)$$

$R_\alpha^i$  represents the contribution of interaction  $\alpha$  on the reaction of the dynamical system  $i$ , and  $B_\alpha^i$  is a  $n_i \times m_\alpha$  block matrix.

And so:

$$R_i = \sum_{\beta \in \mathcal{I}_i} R_\beta^i = \sum_{\beta \in \mathcal{I}_i} B_\beta^i \lambda_\beta \quad (1.5)$$

with  $\mathcal{I}_i$  the set of interactions in which dynamical system number  $i$  is involved.

Introducing the time discretisation, we get:

$$x_i^{k+1} - x_i^k = hA_i x_i^{k+1} + hR_i^{k+1} \quad (1.6)$$

$$y_\alpha^{k+1} = C_\alpha X_\alpha^{k+1} + D_\alpha \lambda_\alpha^{k+1} \quad (1.7)$$

$$R_i^{k+1} = \sum_{\beta \in \mathcal{I}_i} B_\beta^i \lambda_\beta^{k+1} \quad (1.8)$$

ie, with  $W_i = (I - hA_i)^{-1}$ :

$$x_i^{k+1} = W_i x_i^k + hW_i R_i^{k+1} \quad (1.9)$$

$$y_\alpha^{k+1} = C_\alpha W_\alpha X_\alpha^k + C_\alpha hW_\alpha \sum_{\beta \in \mathcal{I}_i} B_\beta^i \lambda_\beta^{k+1} + D_\alpha \lambda_\alpha^{k+1} \quad (1.10)$$

$$= C_\alpha W_\alpha X_\alpha^k + (C_\alpha hW_\alpha B_\alpha + D_\alpha) \lambda_\alpha^{k+1} + \sum_{\beta \neq \alpha} \left( \sum_{i \in \mathcal{DS}_\alpha \cap \mathcal{DS}_\beta} hC_\alpha^i W_i B_\beta^i \lambda_\beta^{k+1} \right) \quad (1.11)$$

with

$$W_\alpha = \begin{bmatrix} W_i & 0 & \dots \\ 0 & W_j & \dots \\ 0 & \dots & \dots \end{bmatrix} \quad (1.12) \quad \{\text{Walpha}\}$$

the block-diagonal matrix of all the  $W$  for the dynamical systems involved in interaction  $\alpha$ .

The global-assembled  $Y$  vector, of dimension  $M$ , composed by  $m$   $y_\alpha$  subvectors, is given by:

$$Y_{k+1} = q_{OSNSP} + M_{OSNSP} \Lambda_{k+1} \quad (1.13)$$

or,

$$Y_{k+1} = \begin{bmatrix} y_1 \\ \dots \\ y_m \end{bmatrix}_{k+1} = \begin{bmatrix} C_1^1 & \dots & C_1^n \\ \vdots & \dots & \vdots \\ C_m^1 & \dots & C_m^n \end{bmatrix} \begin{bmatrix} W_1 & 0 & \dots & 0 \\ 0 & W_2 & \ddots & \vdots \\ \vdots & \ddots & \ddots & \vdots \\ 0 & \dots & 0 & W_n \end{bmatrix} \begin{bmatrix} x_1 \\ \vdots \\ \vdots \\ x_n \end{bmatrix}_k \quad (1.14)$$

$$+ \begin{bmatrix} D_1 + h \sum_{j \in \mathcal{DS}_1} C_1^j W_j B_1^j & h \sum_{j \in \mathcal{DS}_1 \cap \mathcal{DS}_2} C_1^j W_j B_2^j & \dots \\ \vdots & \ddots & \\ h \sum_{j \in \mathcal{DS}_m} C_m^j W_j B_{m-1}^j & D_m + h \sum_{j \in \mathcal{DS}_m \cap \mathcal{DS}_{m-1}} C_m^j W_j B_m^j \end{bmatrix} \begin{bmatrix} \lambda_1 \\ \vdots \\ \lambda_m \end{bmatrix}_k$$

To sum it up, the block-diagonal term of matrix  $M_{OSNSP}$ , for block-row  $\alpha$  is:

$$D_\alpha + h \sum_{j \in \mathcal{DS}_\alpha} C_\alpha^j W_j B_\alpha^j \quad (1.15)$$

This is an  $m_\alpha \times m_\alpha$  square matrix. The extra-diagonal block term, in position  $(\alpha, \beta)$  is:

$$h \sum_{j \in \mathcal{DS}_\alpha \cap \mathcal{DS}_\beta} C_\alpha^j W_j B_\beta^j \quad (1.16)$$

and is a  $m_\alpha \times m_\beta$  matrix. This matrix differs from 0 when interactions  $\alpha$  and  $\beta$  are coupled, ie have common DS.

Or, for the relation  $l$  of interaction  $\alpha$ , we get:

$$D_{\alpha,l} + h \sum_{j \in \mathcal{DS}_\alpha} C_{\alpha,l}^j W_j B_\alpha^j \quad (1.17)$$

for the diagonal, and

$$h \sum_{j \in \mathcal{DS}_\alpha \cap \mathcal{DS}_\beta} C_{\alpha,l}^j W_j B_\beta^j \quad (1.18)$$

for extra-diagonal terms.

$D_{\alpha,l}$ , row number  $l$  of  $D_\alpha$ , the same for  $C_{\alpha,l}$

Finally, the linked-Interaction map provides, for each interaction (named “current interaction”), the list of all the interactions (named “linked interaction”) that have common dynamical system with the “current interaction”.

### 1.1.2 A simple example

We consider  $n = 3$  dynamical systems and  $m = 2$  interactions:

$$\begin{aligned} I_\mu &\rightarrow \mathcal{DS}_\mu = \{DS_1, DS_3\}, m_\mu = 3 \\ I_\theta &\rightarrow \mathcal{DS}_\theta = \{DS_2, DS_3\}, m_\theta = 1 \end{aligned}$$

The linked-interaction map is :

$$\begin{aligned} I_\mu &\rightarrow I_\theta, \text{commonDS} = DS_3 \\ I_\theta &\rightarrow I_\mu, \text{commonDS} = DS_3 \end{aligned}$$

And:

$$M = 4, N = \sum_{i=1}^3 n_i$$

$$\mathcal{I}_1 = \{I_\mu\}$$

$$\mathcal{I}_2 = \{I_\theta\}$$

$$\mathcal{I}_3 = \{I_\mu, I_\theta\}$$

$$y_1 = \begin{bmatrix} C_1^1 & C_1^3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_3 \end{bmatrix} + D_1 \lambda_1 \quad (1.19)$$

$$y_2 = \begin{bmatrix} C_2^2 & C_2^3 \end{bmatrix} \begin{bmatrix} x_2 \\ x_3 \end{bmatrix} + D_2 \lambda_2 \quad (1.20)$$

$$\begin{bmatrix} R_1 \\ R_2 \\ R_3 \end{bmatrix} = \begin{bmatrix} B_1^1 \lambda_1 \\ B_2^2 \lambda_2 \\ B_1^3 \lambda_1 + B_2^3 \lambda_2 \end{bmatrix} \quad (1.21)$$

$$M_{OSNSP} = \begin{bmatrix} D_1 + hC_1^1 W_1 B_1^1 + hC_1^3 W_3 B_1^3 & hC_1^3 W_3 B_2^3 \\ hC_2^3 W_3 B_1^3 & D_2 + hC_2^2 W_2 B_2^2 + hC_2^3 W_3 B_2^3 \end{bmatrix} \begin{bmatrix} \lambda_1 \\ \lambda_2 \end{bmatrix}_{k+1} \quad (1.22)$$

### 1.1.3 relative degree

Let us consider the global vector

$$Y = \begin{bmatrix} y_1 \\ \dots \\ y_M \end{bmatrix} = CX + D\Lambda \quad (1.23)$$

We denote  $r_j$  the relative degree of equation  $j$ ,  $j \in [1..M]$ . We have:

$$y_j = \sum_{i=1}^n C_j^i x_i + D_{j,j} \lambda_j + \sum_{i \neq j, i=1}^m D_{j,i} \lambda_i \quad (1.24)$$

$D_{j,i}$  a scalar and  $C_j^i$  a  $1 \times n_i$  line-vector.

If  $D_{jj} \neq 0$ , then  $r_j = 0$ . Else, we should consider the first derivative of  $y_j$ .

Before that, recall that:

$$R_i = \sum_{k=1}^M B_k^i \lambda_j \quad (1.25)$$

Through many of the  $B_j^i$  are equal to zero, we keep them all in the following lines.

Then:

$$\dot{y}_j = \sum_{i=1}^n C_j^i (A_i x_i + \sum_{k=1}^M B_k^i \lambda_k) + f(\lambda_k)_{k \neq j} \quad (1.26)$$

$$= \sum_{i=1}^n C_j^i (A_i x_i + B_j^i \lambda_j + \sum_{k=1, k \neq j}^M B_k^i \lambda_k) + \dots \quad (1.27)$$

So, if  $\sum_{i=1}^n C_j^i B_j^i \neq 0$  (note that this corresponds to the product between line  $j$  of  $C$  and column  $j$  of  $B$ ) then  $r_j = 1$  else we consider the next derivative, and so on.  
In derivative  $r$ , the coefficient of  $\lambda_j$  will be:

$$coeff_j = \sum_{i=1}^n C_j^i (A_i)^{r-1} B_j^i \quad (1.28)$$

if  $coeff_j \neq 0$  then  $r_j = r$ .

## 1.2 LagrangianDS - Lagrangian Linear Relations

### 1.2.1 General notations

We consider  $n$  dynamical systems, lagrangian and non linear, of the form:

$$M_i(q_i) \ddot{q}_i + N_i(\dot{q}_i, q_i) = F_{Int,i}(\dot{q}_i, q_i, t) + F_{Ext,i}(t) + p_i \quad (1.29)$$

Each system if of dimension  $n_i$ , and we denote  $N = \sum_{i=1}^n n_i$ .

An interaction,  $I_\alpha$  is composed with a non smooth law,  $nslaw_\alpha$  and a relation:

$$y_\alpha = H_\alpha Q_\alpha + b_\alpha \quad (1.30)$$

The “dimension” of the interaction, ie the size of vector  $y_\alpha$ , is denoted  $m_\alpha$  and we set:

$$M_y = \sum_{\alpha=1}^m m_\alpha$$

$m$  being the number of interactions in the Non Smooth Dynamical System.

$Q_\alpha$  is a vector that represents the DS concerned by the interaction. Its dimension is noted  $N_\alpha$ , this for  $n_\alpha$  systems in the interaction.

$H_\alpha$  is a  $m_\alpha \times N_\alpha$  row-blocks matrix and  $b_\alpha$  a  $m_\alpha$  vector.

$$H_\alpha = \begin{bmatrix} H_\alpha^i & H_\alpha^j & \dots \end{bmatrix} \quad (1.31)$$

with  $i, j, \dots \in \mathcal{DS}_\alpha$  which is the set of DS belonging to interaction  $\alpha$ .

We also have the following relation:

$$\begin{bmatrix} R_\alpha^i \\ R_\alpha^j \\ \dots \end{bmatrix} = {}^t H_\alpha \lambda_\alpha = \begin{bmatrix} {}^t H_\alpha^i \\ {}^t H_\alpha^j \\ \dots \end{bmatrix} \lambda_\alpha \quad (1.32)$$

$R_\alpha^i$  represents the contribution of interaction  $\alpha$  on the reaction of the dynamical system  $i$ , and  ${}^t H_\alpha^i$  is a  $n_i \times m_\alpha$  block matrix.

And so:

$$R_i = \sum_{\beta \in \mathcal{I}_i} R_\beta^i = \sum_{\beta \in \mathcal{I}_i} H_\beta^i \lambda_\beta \quad (1.33)$$

with  $\mathcal{I}_i$  the set of interactions in which dynamical system number  $i$  is involved.

Introducing the time discretisation, we get:

$$\begin{aligned} \dot{q}_i^{k+1} &= \dot{q}_{free,i} + W_i R_i^{k+1} \\ \dot{y}_\alpha^{k+1} &= H_\alpha Q_\alpha^{k+1} \end{aligned} \quad (1.34)$$

$$R_i^{k+1} = \sum_{\beta \in \mathcal{I}_i} H_\beta^i \lambda_\beta^{k+1} \quad (1.35)$$

ie,

$$y_\alpha^{k+1} = H_\alpha Q_\alpha^{free} + H_\alpha W_\alpha {}^t H_\alpha \lambda_\alpha + \sum_{i \in \mathcal{DS}_\alpha} \sum_{\beta \in \mathcal{I}_i, \alpha \neq \beta} H_\alpha^i W_i H_\beta^j \lambda_\beta \quad (1.36)$$

with  $W_\alpha$  given by (1.12).

The global-assembled  $Y$  vector, of dimension  $M$ , composed by  $m$   $y_\alpha$  subvectors, is given by:

$$Y_{k+1} = q_{OSNSP} + M_{OSNSP} \Lambda_{k+1} \quad (1.37)$$

with:

$$q_{OSNSP}^\alpha = H_\alpha Q_\alpha^{free} \quad (1.38)$$

and for  $M_{OSNSP}$ , the block-diagonal term for block-row  $\alpha$  is

$$\sum_{j \in \mathcal{DS}_\alpha} H_\alpha^j W_j {}^t H_\alpha^j \quad (1.39)$$

an  $m_\alpha \times m_\alpha$  square matrix. The extra-diagonal block term, in position  $(\alpha, \beta)$  is:

$$\sum_{j \in \mathcal{DS}_\alpha \cap \mathcal{DS}_\beta} H_\alpha^j W_j {}^t H_\beta^j \quad (1.40)$$

and is a  $m_\alpha \times m_\beta$  matrix. This matrix differs from 0 when interactions  $\alpha$  and  $\beta$  are coupled, ie have common DS.

Or, for the relation  $l$  of interaction  $\alpha$ , we get:

$$\sum_{j \in \mathcal{DS}_\alpha} H_{\alpha,l}^j W_j^t H_\alpha^j \quad (1.41)$$

for the diagonal, and

$$\sum_{j \in \mathcal{DS}_\alpha \cap \mathcal{DS}_\beta} H_{\alpha,l}^j W_j^t H_\beta^j \quad (1.42)$$

for extra-diagonal terms.

$H_{\alpha,l}$ , row number  $l$  of  $H_\alpha$ .

WARNING: depending on linear and non linear case for the DS, there should be a factor  $h$  ahead  $W$ . See Bouncing Ball template.

## 1.3 Block matrix approach

The built of the OSNSProblem matrix could be computed using block matrix structure. This section describe these matrices. It is not implemented in Siconos. Using previous notations,  $n$  is the number of DS.  $m$  the number of interactions.

### 1.3.1 Block matrix of DS

$$M\dot{X} = AX + R$$

where  $M = \text{diag}(M_1, \dots, M_n)$  and  $A = \text{diag}(A_1, \dots, A_n)$ .

$$R = B\lambda$$

$$B = \begin{pmatrix} B_1^1 \dots B_m^1 \\ \vdots \\ B_1^n \dots B_m^n \end{pmatrix}$$

Some of  $B_j^i$  doesn't exist.

### 1.3.2 Block matrix of interaction

$$Y = CX + D\lambda$$

with  $D = \text{diag}(D_1 \dots D_m)$  and

$$C = \begin{pmatrix} C_1^1 \dots C_m^1 \\ \vdots \\ C_1^n \dots C_m^n \end{pmatrix}$$

Some of  $C_j^i$  doesn't exist.

### 1.3.3 OSNSProblem using block matrices

The Matrix of the OSNS Problem could be assambled using the following block-product-matrices  $CWB$ .

## Chapter 2

# Dynamical Systems formulations in Siconos.

author	F. P�rignon
date	March 22, 2006
version	Kernel 1.1.4

### 2.1 Class Diagram

There are four possible formulation for dynamical systems in Siconos, two for first order systems and two for second order Lagrangian systems. The main class is `DynamicalSystem`, all other derived from this one, as shown in the following diagram:

{DSDiagram}

### 2.2 General non linear first order dynamical systems

→ **class** *DynamicalSystem*

This is the top class for dynamical systems. All other systems classes derived from this one.

A general dynamical systems is described by the following set of  $n$  equations, completed with initial conditions:

$$\dot{x} = f(x, t) + T(x)u(x, \dot{x}, t) + r \quad (2.1)$$

$$x(t_0) = x_0 \quad (2.2)$$

- $x$ : state of the system - Vector of size  $n$ .
- $f(x, t)$ : vector field - Vector of size  $n$ .

- $u(x, \dot{x}, t)$ : control term - Vector of size  $uSize$ .
- $T(x)$ :  $n \times uSize$  matrix, related to control term.
- $r$ : input due to non-smooth behavior - Vector of size  $n$ .

The Jacobian matrix,  $\nabla_x f(x, t)$ , of  $f$  according to  $x$ ,  $n \times n$  square matrix, is also a member of the class.

Initial conditions are given by the member  $x_0$ , vector of size  $n$ . This corresponds to  $x$  value when simulation is starting, ie after a call to `strategy->initialize()`.

There are plug-in functions in this class for  $f$  (`vectorField`),  $jacobianX$ ,  $u$  and  $T$ . All of them can handle a vector of user-defined parameters.

## 2.3 First order linear dynamical systems → class *LinearDS*

Derived from `DynamicalSystem`, described by the set of  $n$  equations and initial conditions:

$$\dot{x} = A(t)x(t) + Tu(t) + b(t) + r \quad (2.3)$$

$$x(t_0) = x_0 \quad (2.4)$$

With:

- $A(t)$ :  $n \times n$  matrix, state independent but possibly time-dependent.
- $b(t)$ : Vector of size  $n$ , possibly time-dependent.

Other variables are those of `DynamicalSystem` class.  
 $A$  and  $B$  have corresponding plug-in functions.

Warning: time dependence for  $A$  and  $b$  is not available at the time in the simulation part for this kind of dynamical systems.

Links with `vectorField` and its Jacobian are:

$$f(x, t) = A(t)x(t) + b(t) \quad (2.5)$$

$$jacobianX = \nabla_x f(x, t) = A(t) \quad (2.6)$$

## 2.4 Second order non linear Lagrangian dynamical systems → class *LagrangianDS*

Lagrangian second order non linear systems are described by the following set of  $nDof$  equations + initial conditions:

$$M(q)\ddot{q} + NNL(\dot{q}, q) + F_{Int}(\dot{q}, q, t) = F_{Ext}(t) + p \quad (2.7)$$

$$q(t_0) = q_0 \quad (2.8)$$

$$\dot{q}(t_0) = velocity_0 \quad (2.9)$$

With:

- $M(q)$ :  $nDof \times nDof$  matrix of inertia.
- $q$ : state of the system - Vector of size  $nDof$ .
- $\dot{q}$  or *velocity*: derivative of the state according to time - Vector of size  $nDof$ .

- $NNL(\dot{q}, q)$ : non linear terms, time-independent - Vector of size  $nDof$ .
- $F_{Int}(\dot{q}, q, t)$ : time-dependent linear terms - Vector of size  $nDof$ .
- $F_{Ext}(t)$ : external forces, time-dependent BUT do not depend on state - Vector of size  $nDof$ .
- $p$ : input due to non-smooth behavior - Vector of size  $nDof$ .

The following Jacobian are also member of this class:

- $jacobianQFInt = \nabla_q F_{Int}(t, q, \dot{q})$  -  $nDof \times nDof$  matrix.
- $jacobianVelocityFInt = \nabla_{\dot{q}} F_{Int}(t, q, \dot{q})$  -  $nDof \times nDof$  matrix.
- $jacobianQNNL = \nabla_q NNL(q, \dot{q})$  -  $nDof \times nDof$  matrix.
- $jacobianVelocityNNL = \nabla_{\dot{q}} NNL(q, \dot{q})$  -  $nDof \times nDof$  matrix.

There are plug-in functions in this class for  $F_{int}$ ,  $F_{Ext}$ ,  $M$ ,  $NNL$  and the four Jacobian matrices. All of them can handle a vector of user-defined parameters.

Links with first order dynamical system are:

$$n = 2nDof \quad (2.10)$$

$$x = \begin{bmatrix} q \\ \dot{q} \end{bmatrix} \quad (2.11)$$

$$f(x, t) = \begin{bmatrix} \dot{q} \\ M^{-1}(F_{Ext} - F_{Int} - NNL) \end{bmatrix} \quad (2.12)$$

$$\nabla_x f(x, t) = \begin{bmatrix} 0_{nDof \times nDof} & I_{nDof \times nDof} \\ \nabla_q(M^{-1})(F_{Ext} - F_{Int} - NNL) - M^{-1}\nabla_q(F_{Int} + NNL) & -M^{-1}\nabla_{\dot{q}}(F_{Int} + NNL) \end{bmatrix} \quad (2.13)$$

$$r = \begin{bmatrix} 0_{nDof} \\ p \end{bmatrix} \quad (2.14)$$

$$u(x, \dot{x}, t) = u_L(\dot{q}, q, t) \text{ (not yet implemented)} \quad (2.15)$$

$$T(x) = \begin{bmatrix} 0_{nDof} \\ T_L(q) \end{bmatrix} \text{ (not yet implemented)} \quad (2.16)$$

$$(2.17)$$

$$(2.18)$$

With  $0_n$  a vector of zero of size  $n$ ,  $0_{n \times m}$  a  $n \times m$  zero matrix and  $I_{n \times n}$ , identity  $n \times n$  matrix.

Warning: control terms ( $Tu$ ) are not fully implemented in Lagrangian systems. This will be part of future version.

## 2.5 Second order linear and time-invariant Lagrangian dynamical systems $\rightarrow$ class *LagrangianLinearTIDS*

$$M\ddot{q} + C\dot{q} + Kq = F_{Ext}(t) + p \quad (2.19)$$

With:

- $C$ : constant viscosity  $nDof \times nDof$  matrix
- $K$ : constant rigidity  $nDof \times nDof$  matrix

And:

$$F_{Int} = C\dot{q} + Kq \quad (2.20)$$

$$NNL = 0_{nDof} \quad (2.21)$$

## Chapter 3

# Dynamical Systems implementation in Siconos.

author	F. P�rignon
date	November 7, 2006
version	Kernel 1.3.0

### 3.1 Introduction

This document is only a sequel of notes and remarks on the way Dynamical Systems are implemented in Siconos.

It has to be completed, reviewed, reorganized etc etc for a future Developers' Guide.

See also documentation in Doc/User/DynamicalSystemsInSiconos for a description of various dynamical systems types.

### 3.2 Class Diagram

There are four possible formulation for dynamical systems in Siconos, two for first order systems and two for second order Lagrangian systems. The main class is DynamicalSystem, all other derived from this one, as shown in the following diagram:

{DSDiagram}

### 3.3 Construction

Each constructor must:

- initialize all the members of the class and of the top-class if it exists

- allocate memory and set value for all required inputs
- allocate memory and set value for optional input if they are given as argument (in xml for example)
- check that given data are coherent and that the system is complete (for example, in the LagrangianDS if the internal forces are given as a plug-in, their Jacobian are also required. If they are not given, this leads to an exception).

No memory allocation is made for unused members  $\Rightarrow$  requires if statements in simulation. (if!=NULL ...).

### 3.3.1 DynamicalSystem

**Required data:**

$n, x0, f, jacobianXF$

**Optional:**

$T, u$

**Always allocated in constructor:**

$x, x0, xFree, r, rhs, jacobianXF$

Warning: default constructor is always private or protected and apart from the others and previous rules or remarks do not always apply to it. This for DS class and any of the derived ones.

### 3.3.2 LagrangianDS

**Required data:**

$ndof, q0, velocity0, mass$

**Optional:**

$fInt$  and its Jacobian,  $fExt$ ,  $NNL$  and its Jacobian.

**Always allocated in constructor:**

$mass, q, q0, qFree, velocity, velocity0, velocityFree, p.$

All other pointers to vectors/matrices are set to NULL by default.

Memory vectors are required but allocated during call to `initMemory` function.

Various rules:

- $fInt$  (NNL) given as a plug-in  $\Rightarrow$  check that JacobianQ/Velocity are present (matrices or plug-in)
- any of the four Jacobian present  $\Rightarrow$  allocate memory for block-matrix `jacobianX` (`connectToDS` function)
- 

check: end of constructor or in `initialize`?

`computeF` and `JacobianF` + corresponding set functions: virtual or not?

## 3.4 Specific flags or members

- `isAllocatedIn`: to check inside-class memory allocation
- `isPlugin`: to check if operators are computed with plug-in or just directly set as a matrix or vector
- `workMatrix`: used to save some specific matrices in order to avoid recomputation if possible (inverse of mass ...)

### 3.5 plug-in management

DynamicalSystem class has a member named parameterList which is a *map*  $\langle \text{string}, \text{SimpleVector}^* \rangle$ , ie a list of pointers to SimpleVector\*, with a string as a key to identified them. For example, *parametersList*["mass"] is a SimpleVector\*, which corresponds to the last argument given in mass plug-in function.

By default, each parameters vectors must be initialized with a SimpleVector of size 1, as soon as the plug-in is declared. Moreover, to each vector corresponds a flag in *isAllocatedIn* map, to check if the corresponding vector has been allocated inside the class or not.

For example, in DynamicalSystem, if *isPlugin*["vectorField"] == *true*, then, during call to constructor or set function, it is necessary to defined the corresponding parameter:

```
parametersList["vectorField"] = newSimpleVector(1)
```

and to complete the *isAllocatedIn* flag:

```
isAllocatedIn["parameter_for_vectorField"] = true.
```

# Chapter 4

## Interactions

author	F. Pérignon
date	November 7, 2006
version	Kernel 1.3.0

### 4.1 Introduction

This document is only a sequel of notes and remarks on the way Interactions are implemented in Siconos.

It has to be completed, reviewed, reorganized etc etc for a future Developers' Guide.  
See also documentation in Doc/User/Interaction.

### 4.2 Class Diagram

### 4.3 Description

#### 4.3.1 Redaction note F. PERIGNON

review of interactions (for EventDriven implementation) 17th May 2006.

- variable *nInter* renamed in *interactionSize*: represents the size of  $y$  and  $\lambda$ . NOT the number of relations !!
- add a variable *nsLawSize* that depends on the non-smooth law type.  
Examples:
  - NewtonImpact -> *nsLawSize* = 1
  - Friction 2D -> *nsLawSize* = 2
  - Friction 3D -> *nsLawSize* = 3
  - ...
  - *nsLawSize* =  $n$  with  $n$  dim of matrix  $D$  in :  $y = Cx + D\lambda$ ,  $D$  supposed to be a full-ranked matrix.  
Warning: this case is represented by only one relation of size  $n$ .
- *numberOfRelations*: number of relations in the interaction,  $numberOfRelations = \frac{interactionSize}{nsLawSize}$ .

## Chapter 5

# Notes on the Non Smooth Dynamical System construction

author	F. Pérignon
date	November 7, 2006
version	Kernel 1.3.0

### 5.1 Introduction

### 5.2 Class Diagram

### 5.3 Description

Objects must be constructed in the following order:

- DynamicalSystems
- NonSmoothLaw: depends on nothing
- Relation: no link with an interaction during construction, this will be done during initialization.
- Interaction: default constructor is private and copy is forbidden. Two constructors: xml and from data. Required data are a DSSet, a NonSmoothLaw and a Relation (+ dim of the Interaction and a number).  
Interaction has an initialize function which allocates memory for y and lambda, links correctly the relation and initializes it .... This function is called at the end of the constructor. That may be better to call it in simulation->initialize? Pb: xml constructor needs memory allocation for y and lambda if they are provided in the input xml file.
- NonSmoothDynamicalSystem: default is private, copy forbidden. Two constructors: xml and from data. Required data are the DSSet and the InteractionsSet. The topology is declared and constructed (but empty) during constructor call of the nsds, but initialize in the Simulation, this because it can not be initialize until the nsds has been fully described (ie this to allow user to add DS, Inter ...) at any time in the model, but before simulation initialization).

## 5.4 misc

- no need to keep a number for Interactions? Only used in xml for OSI, to know which Interactions it holds.
- pb: the number of saved derivatives for  $y$  and  $\lambda$  in Interactions is set to 2. This must depends on the relative degree which is computes during Simulation initialize and thus too late. It is so not available when memory is allocated (Interaction construction). Problem-> to be reviewed.

## Chapter 6

# OneStepIntegrator and derived classes.

author	F. Pérignon
date	November 7, 2006
version	Kernel 1.3.0

### 6.1 Introduction

This document is only a sequel of notes and remarks on the way OneStepIntegrators are implemented in Siconos.

It has to be completed, reviewed, reorganized etc etc for a future Developers' Guide.

See also documentation in Doc/User/OneStepIntegrator for a description of various OSI.

### 6.2 Class Diagram

### 6.3 Misc

OSI review for consistency between Lsodar and Moreau:

- add set of DynamicalSystem\*
- add set of Interaction\*
- add link to strategy that owns the OSI
- remove td object in OSI -> future: replace it by a set of td (one per ds)
- add strat in constructors arg list

osi -> strat -> Model -> nsds -> topology

osi -> strat -> timeDiscretisation

let a timeDiscretisation object in the OSI? set of td (one per ds)?  
create a class of object that corresponds to DS on the simulation side ?  
will contain the DS, its discretization, theta for Moreau ... ?  
Allow setStrategyPtr operation? Warning: need reinitialisation.

Required input by user:

- list of DS or list of Interactions ?
- pointer to strategy
- ...

## 6.4 Construction

Each constructor must:

- 

### 6.4.1 Moreau

Two maps: one for  $W$ , and one for  $\theta$ . To each DS corresponds a  $\theta$  and a  $W$ .  
Strategy arg in each constructor.

**Required data:**

**Optional:**

**Always allocated in constructor:**

Warning: default constructor is always private or protected and apart from the others and previous rules or remarks do not always apply to it.

### 6.4.2 Lsodar

**Required data:**

**Optional:**

**Always allocated in constructor:**

# First Order Nonlinear Relation

author	O. Bonnefon
date	July, 1 2009
version	Kernel 3.0.0

## Chapter 8

# Newton's linearization

author	O.Bonnefon, V. Acary
date	Sept, 07, 2007
last update	Feb, 2011
version	

This section is devoted to the implementation and the study of the algorithm. The interval of integration is  $[0, T]$ ,  $T > 0$ , and a grid  $t_0 = 0, t_{k+1} = t_k + h, k \geq 0, t_N = T$  is constructed. The approximation of a function  $f(\cdot)$  on  $[0, T]$  is denoted as  $f^N(\cdot)$ , and is a piecewise constant function, constant on the intervals  $[t_k, t_{k+1})$ . We denote  $f^N(t_k)$  as  $f_k$ . The time-step is  $h > 0$ .

### 8.1 Various first order dynamical systems with input/output relations

**Fully nonlinear case** Let us introduce the following system,

$$\begin{aligned} M\dot{x}(t) &= f(x(t), t) + r(t) \\ y(t) &= h(t, x(t), \lambda(t)) \\ r(t) &= g(t, x(t), \lambda(t)) \end{aligned} \tag{8.1} \quad \{\text{first-DS}\}$$

where  $\lambda(t) \in \mathbf{R}^m$  and  $y(t) \in \mathbf{R}^m$  are complementary variables related through a multi-valued mapping. According to the class of systems, we are studying, the function  $f$  and  $g$  are defined by a fully nonlinear framework or by affine functions. We have decided to present the time-discretization in its full generality and specialize the algorithms for each cases in Section ???. This fully nonlinear case is not implemented in Siconos yet. This fully general case is not yet implemented in Siconos.

**FirstOrderType2R** Let us introduce a new notation,

$$\begin{aligned} M\dot{x}(t) &= f(x(t), t) + r(t) \\ y(t) &= h(t, x(t), \lambda(t)) \\ r(t) &= g(t, \lambda(t)) \end{aligned} \tag{8.2} \quad \{\text{first-DS2}\}$$

This case is implemented in Siconos with the relation FirstOrderType2R.

**Linear case** Let us introduce anew notation,

$$\begin{aligned} M\dot{x}(t) &= Ax(t) + r(t) + b(t) \\ y(t) &= h(x(t), \lambda(t), z) = Cx + Fz + D\lambda \\ r(t) &= g(t, \lambda(t)) = B\lambda \end{aligned} \tag{8.3} \quad \{\text{fisrt-DS3}\}$$

## 8.2 Time-discretizations

### 8.2.1 Standard $\theta - \gamma$ scheme.

Let us now proceed with the time discretization of (8.1) by a fully implicit scheme :

$$\begin{aligned} Mx_{k+1} &= Mx_k + h\theta f(x_{k+1}, t_{k+1}) + h(1 - \theta)f(x_k, t_k) + h\gamma r(t_{k+1}) + h(1 - \gamma)r(t_k) \\ y_{k+1} &= h(t_{k+1}, x_{k+1}, \lambda_{k+1}) \\ r_{k+1} &= g(x_{k+1}, \lambda_{k+1}, t_{k+1}) \end{aligned} \tag{8.4} \quad \{\text{eq:toto1}\}$$

where  $\theta = [0, 1]$  and  $\gamma \in [0, 1]$ . As in ?, we call the problem (8.4) the “one-step nonsmooth problem”.

This time-discretization is slightly more general than a standard implicit Euler scheme. The main discrepancy lies in the choice of a  $\theta$ -method to integrate the nonlinear term  $f$ . For  $\theta = 0$ , we retrieve the explicit integration of the smooth and single valued term  $f$ . Moreover for  $\gamma = 0$ , the term  $g$  is explicitly evaluated. The flexibility in the choice of  $\theta$  and  $\gamma$  allows the user to improve and control the accuracy, the stability and the numerical damping of the proposed method. For instance, if the smooth dynamics given by  $f$  is stiff, or if we have to use big step sizes for practical reasons, the choice of  $\theta > 1/2$  offers better stability with the respect to  $h$ .

### 8.2.2 Full $\theta - \gamma$ scheme

$$\begin{aligned} Mx_{k+1} &= Mx_k + hf(x_{k+\theta}, t_{k+1}) + hr(t_{k+\gamma}) \\ y_{k+\gamma} &= h(t_{k+\gamma}, x_{k+\gamma}, \lambda_{k+\gamma}) \\ r_{k+\gamma} &= g(x_{k+\gamma}, \lambda_{k+\gamma}, t_{k+\gamma}) \\ \text{NsLaw}(y_{k+\gamma}, \lambda_{k+\gamma}) \end{aligned} \tag{8.5} \quad \{\text{eq:toto1-ter}\}$$

### 8.3 Newton's linearization of (8.4)

Due to the fact that two of the studied classes of systems that are studied in this paper are affine functions in terms of  $f$  and  $g$ , we propose to solve the "one-step nonsmooth problem" (8.4) by performing an external Newton linearization.

**Newton's linearization of the first line of (8.4)** The first line of the problem (8.4) can be written under the form of a residue  $\mathcal{R}$  depending only on  $x_{k+1}$  and  $r_{k+1}$  such that

$$\mathcal{R}(x_{k+1}, r_{k+1}) = 0 \quad (8.6) \quad \{\text{eq:NL3}\}$$

with  $\mathcal{R}(x, r) = M(x - x_k) - h\theta f(x, t_{k+1}) - h(1 - \theta)f(x_k, t_k) - h\gamma r - h(1 - \gamma)r_k$ . The solution of this system of nonlinear equations is sought as a limit of the sequence  $\{x_{k+1}^\alpha, r_{k+1}^\alpha\}_{\alpha \in \mathbb{N}}$  such that

$$\begin{cases} x_{k+1}^0 = x_k \\ \mathcal{R}_L(x_{k+1}^{\alpha+1}, r_{k+1}^{\alpha+1}) = \mathcal{R}(x_{k+1}^\alpha, r_{k+1}^\alpha) + [\nabla_x \mathcal{R}(x_{k+1}^\alpha, r_{k+1}^\alpha)] (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) + [\nabla_r \mathcal{R}(x_{k+1}^\alpha, r_{k+1}^\alpha)] (r_{k+1}^{\alpha+1} - r_{k+1}^\alpha) = 0 \end{cases} \quad (8.7) \quad \{\text{eq:NL7}\}$$

#### 8.3.1 Redaction note V. ACARY

What about  $r_{k+1}^0$  ?

The residu free is also defined (useful for implementation only):

$$\mathcal{R}_{free}(x) \triangleq M(x - x_k) - h\theta f(x, t_{k+1}) - h(1 - \theta)f(x_k, t_k),$$

which yields

$$\mathcal{R}(x, r) = \mathcal{R}_{free}(x) - h\gamma r - h(1 - \gamma)r_k.$$

$$\mathcal{R}(x_{k+1}^\alpha, r_{k+1}^\alpha) = \boxed{\mathcal{R}_{k+1}^\alpha \triangleq \mathcal{R}_{free}(x_{k+1}^\alpha, r_{k+1}^\alpha) - h\gamma r_{k+1}^\alpha - h(1 - \gamma)r_k} \quad (8.8) \quad \{\text{eq:rfree-1}\}$$

$$\mathcal{R}_{free}(x_{k+1}^\alpha, r_{k+1}^\alpha) = \boxed{\mathcal{R}_{freek+1}^\alpha \triangleq M(x_{k+1}^\alpha - x_k) - h\theta f(x_{k+1}^\alpha, t_{k+1}) - h(1 - \theta)f(x_k, t_k)}$$

The computation of the Jacobian of  $\mathcal{R}$  with respect to  $x$ , denoted by  $W_{k+1}^\alpha$  leads to

$$W_{k+1}^\alpha \triangleq \nabla_x \mathcal{R}(x_{k+1}^\alpha, r_{k+1}^\alpha) = M - h\theta \nabla_x f(x_{k+1}^\alpha, t_{k+1}). \quad (8.9) \quad \{\text{eq:NL9}\}$$

At each time-step, we have to solve the following linearized problem,

$$\mathcal{R}_{k+1}^\alpha + W_{k+1}^\alpha (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) - h\gamma (r_{k+1}^{\alpha+1} - r_{k+1}^\alpha) = 0, \quad (8.10) \quad \{\text{eq:NL10}\}$$

By using (8.8), we get

$$\mathcal{R}_{free}(x_{k+1}^\alpha, r_{k+1}^\alpha) - h\gamma r_{k+1}^{\alpha+1} - h(1 - \gamma)r_k + W_{k+1}^\alpha (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) = 0 \quad (8.11) \quad \{\text{eq:rfree-2}\}$$

$$\boxed{x_{k+1}^{\alpha+1} = h(W_{k+1}^\alpha)^{-1} r_{k+1}^{\alpha+1} + x_{free}^\alpha} \quad (8.12)$$

with :

$$x_{free}^\alpha \triangleq x_{k+1}^\alpha - (W_{k+1}^\alpha)^{-1} (R_{freek+1}^\alpha - h(1-\gamma)r_k) \quad (8.13) \quad \{\text{eq:rfree-12}\}$$

The matrix  $W$  is clearly non singular for small  $h$ .

**Newton's linearization of the second line of (8.4)** The same operation is performed with the second equation of (8.4)

$$\mathcal{R}_y(x, y, \lambda) = y - h(t_{k+1}, x, \lambda) = 0 \quad (8.14)$$

which is linearized as

$$\begin{aligned} \mathcal{R}_{Ly}(x_{k+1}^{\alpha+1}, y_{k+1}^{\alpha+1}, \lambda_{k+1}^{\alpha+1}) &= \mathcal{R}_y(x_{k+1}^\alpha, y_{k+1}^\alpha, \lambda_{k+1}^\alpha) + (y_{k+1}^{\alpha+1} - y_{k+1}^\alpha) - \\ &C_{k+1}^\alpha (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) - D_{k+1}^\alpha (\lambda_{k+1}^{\alpha+1} - \lambda_{k+1}^\alpha) = 0 \end{aligned} \quad (8.15) \quad \{\text{eq:NL9}\}$$

This leads to the following linear equation

$$y_{k+1}^{\alpha+1} = y_{k+1}^\alpha - \mathcal{R}_{y_{k+1}}^\alpha + C_{k+1}^\alpha (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) + D_{k+1}^\alpha (\lambda_{k+1}^{\alpha+1} - \lambda_{k+1}^\alpha) \quad (8.16) \quad \{\text{eq:NL11y}\}$$

with,

$$C_{k+1}^\alpha = \nabla_x h(t_{k+1}, x_{k+1}^\alpha, \lambda_{k+1}^\alpha) \quad (8.17)$$

$$D_{k+1}^\alpha = \nabla_\lambda h(t_{k+1}, x_{k+1}^\alpha, \lambda_{k+1}^\alpha)$$

and

$$\mathcal{R}_{y_{k+1}}^\alpha \triangleq y_{k+1}^\alpha - h(x_{k+1}^\alpha, \lambda_{k+1}^\alpha) \quad (8.18)$$

**Newton's linearization of the third line of (8.4)** The same operation is performed with the third equation of (8.4)

$$\mathcal{R}_r(r, x, \lambda) = r - g(x, \lambda, t_{k+1}) = 0 \quad (8.19)$$

which is linearized as

$$\mathcal{R}_{L\lambda}(r_{k+1}^{\alpha+1}, x_{k+1}^{\alpha+1}, \lambda_{k+1}^{\alpha+1}) = \mathcal{R}_{r_{k+1}}^\alpha + (r_{k+1}^{\alpha+1} - r_{k+1}^\alpha) - K_{k+1}^\alpha (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) - B_{k+1}^\alpha (\lambda_{k+1}^{\alpha+1} - \lambda_{k+1}^\alpha) = 0 \quad (8.20) \quad \{\text{eq:NL9}\}$$

$$r_{k+1}^{\alpha+1} = g(x_{k+1}^\alpha, \lambda_{k+1}^\alpha, t_{k+1}) - B_{k+1}^\alpha \lambda_{k+1}^\alpha + B_{k+1}^\alpha \lambda_{k+1}^{\alpha+1} - K_{k+1}^\alpha x_{k+1}^\alpha + K_{k+1}^\alpha x_{k+1}^{\alpha+1} \quad (8.21) \quad \{\text{eq:rrL}\}$$

with,

$$K_{k+1}^\alpha = \nabla_x g(x_{k+1}^\alpha, \lambda_{k+1}^\alpha, t_{k+1}) \quad (8.22)$$

$$B_{k+1}^\alpha = \nabla_\lambda g(x_{k+1}^\alpha, \lambda_{k+1}^\alpha, t_{k+1})$$

and the residue for  $r$ :

$$\mathcal{R}_{r_{k+1}}^\alpha = r_{k+1}^\alpha - g(x_{k+1}^\alpha, \lambda_{k+1}^\alpha, t_{k+1}) \quad (8.23)$$

**Reduction to a linear relation between  $x_{k+1}^{\alpha+1}$  and  $\lambda_{k+1}^{\alpha+1}$**  Inserting (8.21) into (8.13), we get the following linear relation between  $x_{k+1}^{\alpha+1}$  and  $\lambda_{k+1}^{\alpha+1}$ ,

$$x_{k+1}^{\alpha+1} = h\gamma(W_{k+1}^\alpha)^{-1} \left[ g(x_{k+1}^\alpha, \lambda_{k+1}^\alpha, t_{k+1}) + B_{k+1}^\alpha (\lambda_{k+1}^{\alpha+1} - \lambda_{k+1}^\alpha) + K_{k+1}^\alpha (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) \right] + x_{free}^\alpha \quad (8.24)$$

that is

$$(I - h\gamma(W_{k+1}^\alpha)^{-1} K_{k+1}^\alpha) x_{k+1}^{\alpha+1} = x_p + h\gamma(W_{k+1}^\alpha)^{-1} B_{k+1}^\alpha \lambda_{k+1}^{\alpha+1} \quad (8.25)$$

with

$$x_p \triangleq h\gamma(W_{k+1}^\alpha)^{-1} \left[ g(x_{k+1}^\alpha, \lambda_{k+1}^\alpha, t_{k+1}) - B_{k+1}^\alpha (\lambda_{k+1}^\alpha) - K_{k+1}^\alpha (x_{k+1}^\alpha) \right] + x_{free}^\alpha \quad (8.26)$$

Let us define the new matrix

$$\hat{K}_{k+1}^\alpha = (I - h\gamma(W_{k+1}^\alpha)^{-1} K_{k+1}^\alpha). \quad (8.27) \quad \{\text{eq:hatW}\}$$

We get the linear relation

$$x_{k+1}^{\alpha+1} \triangleq \hat{K}_{k+1}^{\alpha,-1} x_p + \hat{K}_{k+1}^{\alpha,-1} \left[ h\gamma(W_{k+1}^\alpha)^{-1} B_{k+1}^\alpha \lambda_{k+1}^{\alpha+1} \right] \quad (8.28) \quad \{\text{eq:rfree-13}\}$$

**Reduction to a linear relation between  $y_{k+1}^{\alpha+1}$  and  $\lambda_{k+1}^{\alpha+1}$**  Inserting (8.28) into (8.16), we get the following linear relation between  $y_{k+1}^{\alpha+1}$  and  $\lambda_{k+1}^{\alpha+1}$ ,

$$y_{k+1}^{\alpha+1} = y_p + [hC_{k+1}^\alpha (\tilde{K}_{k+1}^\alpha)^{-1} (W_{k+1}^\alpha)^{-1} B_{k+1}^\alpha + D_{k+1}^\alpha] \lambda_{k+1}^{\alpha+1} \quad (8.29)$$

with

$$y_p = y_{k+1}^\alpha - \mathcal{R}_{y_{k+1}}^\alpha + C_{k+1}^\alpha(x_q) - D_{k+1}^\alpha \lambda_{k+1}^\alpha \quad (8.30)$$

$$x_q = (\tilde{K}_{k+1}^\alpha)^{-1} x_p - x_{k+1}^\alpha \quad (8.31) \quad \{\text{eq:xqq}\}$$

**Mixed linear complementarity problem (MLCP)** To summarize, the problem to be solved in each Newton iteration is:

$$\begin{cases} y_{k+1}^{\alpha+1} = W_{mlcpk+1}^\alpha \lambda_{k+1}^{\alpha+1} + b_{k+1}^\alpha \\ -y_{k+1}^{\alpha+1} \in N_{[l,u]}(\lambda_{k+1}^{\alpha+1}). \end{cases} \quad (8.32) \quad \{\text{eq:NL14}\}$$

with  $W_{mlcpk+1}^\alpha \in \mathbb{R}^{m \times m}$  and  $b \in \mathbb{R}^m$  defined by

$$\begin{aligned} W_{mlcpk+1}^\alpha &= hC_{k+1}^\alpha (\tilde{K}_{k+1}^\alpha)^{-1} (W_{k+1}^\alpha)^{-1} B_{k+1}^\alpha + D_{k+1}^\alpha \\ b_{k+1}^\alpha &= y_p \end{aligned} \quad (8.33) \quad \{\text{eq:NL15}\}$$

The problem (8.32) is equivalent to a Mixed Linear Complementarity Problem (MLCP) which can be solved under suitable assumptions by many linear complementarity solvers such as pivoting techniques, interior point techniques and splitting/projection strategies. The reformulation into a standard

MLCP follows the same line as for the MCP in the previous section. One obtains,

$$\begin{aligned}
 y_{k+1}^{\alpha+1} &= -W_{k+1}^{\alpha} \lambda_{k+1}^{\alpha+1} + b_{k+1}^{\alpha} \\
 (y_{k+1}^{\alpha+1})_i &= 0 \quad \text{for } i \in \{1..n\} \\
 0 \leq (\lambda_{k+1}^{\alpha+1})_i \perp (y_{k+1}^{\alpha+1})_i &\geq 0 \quad \text{for } i \in \{n..n+m\}
 \end{aligned}
 \tag{8.34} \quad \{\text{eq:MLCP1}\}$$

## 8.4 Newton's linearization of (8.2)

Let us now proceed with the time discretization of (8.2) by a fully implicit scheme :

$$\begin{aligned} Mx_{k+1} &= Mx_k + h\theta f(x_{k+1}, t_{k+1}) + h(1 - \theta)f(x_k, t_k) + h\gamma r(t_{k+1}) + h(1 - \gamma)r(t_k) \\ y_{k+1} &= h(t_{k+1}, x_{k+1}, \lambda_{k+1}) \\ r_{k+1} &= g(\lambda_{k+1}, t_{k+1}) \end{aligned} \quad (8.35) \quad \text{\texttt{\{eq:mlcp2-tot}}}$$

**Newton's linearization of the first line of (??)** The first line of the problem (??) can be written under the form of a residue  $\mathcal{R}$  depending only on  $x_{k+1}$  and  $r_{k+1}$  such that

$$\mathcal{R}(x_{k+1}, r_{k+1}) = 0 \quad (8.36) \quad \text{\texttt{\{eq:mlcp2-NL3}}$$

with  $\mathcal{R}(x, r) = M(x - x_k) - h\theta f(x, t_{k+1}) - h(1 - \theta)f(x_k, t_k) - h\gamma r - h(1 - \gamma)r_k$ . The solution of this system of nonlinear equations is sought as a limit of the sequence  $\{x_{k+1}^\alpha, r_{k+1}^\alpha\}_{\alpha \in \mathbf{N}}$  such that

$$\begin{cases} x_{k+1}^0 = x_k \\ \mathcal{R}_L(x_{k+1}^{\alpha+1}, r_{k+1}^{\alpha+1}) = \mathcal{R}(x_{k+1}^\alpha, r_{k+1}^\alpha) + [\nabla_x \mathcal{R}(x_{k+1}^\alpha, r_{k+1}^\alpha)] (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) + [\nabla_r \mathcal{R}(x_{k+1}^\alpha, r_{k+1}^\alpha)] (r_{k+1}^{\alpha+1} - r_{k+1}^\alpha) = 0 \end{cases} \quad (8.37) \quad \text{\texttt{\{eq:mlcp2-NL7}}$$

### 8.4.1 Redaction note V. ACARY

What about  $r_{k+1}^0$  ?

The residu free is also defined (useful for implementation only):

$$\mathcal{R}_{free}(x) \triangleq M(x - x_k) - h\theta f(x, t_{k+1}) - h(1 - \theta)f(x_k, t_k),$$

which yields

$$\mathcal{R}(x, r) = \mathcal{R}_{free}(x) - h\gamma r - h(1 - \gamma)r_k.$$

$$\mathcal{R}(x_{k+1}^\alpha, r_{k+1}^\alpha) = \boxed{\mathcal{R}_{k+1}^\alpha \triangleq \mathcal{R}_{free}(x_{k+1}^\alpha, r_{k+1}^\alpha) - h\gamma r_{k+1}^\alpha - h(1 - \gamma)r_k} \quad (8.38) \quad \text{\texttt{\{eq:mlcp2-rfr}}$$

$$\mathcal{R}_{free}(x_{k+1}^\alpha, r_{k+1}^\alpha) = \boxed{\mathcal{R}_{freek+1}^\alpha \triangleq M(x_{k+1}^\alpha - x_k) - h\theta f(x_{k+1}^\alpha, t_{k+1}) - h(1 - \theta)f(x_k, t_k)}$$

The computation of the Jacobian of  $\mathcal{R}$  with respect to  $x$ , denoted by  $W_{k+1}^\alpha$  leads to

$$W_{k+1}^\alpha \triangleq \nabla_x \mathcal{R}(x_{k+1}^\alpha, r_{k+1}^\alpha) = M - h\theta \nabla_x f(x_{k+1}^\alpha, t_{k+1}). \quad (8.39) \quad \text{\texttt{\{eq:mlcp2-NL9}}$$

At each time-step, we have to solve the following linearized problem,

$$\mathcal{R}_{k+1}^\alpha + W_{k+1}^\alpha (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) - h\gamma (r_{k+1}^{\alpha+1} - r_{k+1}^\alpha) = 0, \quad (8.40) \quad \text{\texttt{\{eq:mlcp2-NL1}}$$

By using (8.38), we get

$$\mathcal{R}_{free}(x_{k+1}^\alpha, r_{k+1}^\alpha) - h\gamma r_{k+1}^{\alpha+1} - h(1 - \gamma)r_k + W_{k+1}^\alpha (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) = 0 \quad (8.41) \quad \text{\texttt{\{eq:mlcp2-rfr}}$$

$$x_{k+1}^{\alpha+1} = h(W_{k+1}^{\alpha})^{-1}r_{k+1}^{\alpha+1} + x_{free}^{\alpha} \quad (8.42)$$

with :

$$x_{free}^{\alpha} \triangleq x_{k+1}^{\alpha} - (W_{k+1}^{\alpha})^{-1}(R_{freek+1}^{\alpha} - h(1-\gamma)r_k) \quad (8.43) \quad \{\text{eq:mlcp2-rf}\}$$

The matrix  $W$  is clearly non singular for small  $h$ .

**Newton's linearization of the second line of (8.35)** The same operation is performed with the second equation of (8.35)

$$\mathcal{R}_y(x, y, \lambda) = y - h(t_{k+1}, x, \lambda) = 0 \quad (8.44)$$

which is linearized as

$$\begin{aligned} \mathcal{R}_{Ly}(x_{k+1}^{\alpha+1}, y_{k+1}^{\alpha+1}, \lambda_{k+1}^{\alpha+1}) &= \mathcal{R}_y(x_{k+1}^{\alpha}, y_{k+1}^{\alpha}, \lambda_{k+1}^{\alpha}) + (y_{k+1}^{\alpha+1} - y_{k+1}^{\alpha}) - \\ &C_{k+1}^{\alpha}(x_{k+1}^{\alpha+1} - x_{k+1}^{\alpha}) - D_{k+1}^{\alpha}(\lambda_{k+1}^{\alpha+1} - \lambda_{k+1}^{\alpha}) = 0 \end{aligned} \quad (8.45) \quad \{\text{eq:mlcp2-NLS}\}$$

This leads to the following linear equation

$$y_{k+1}^{\alpha+1} = y_{k+1}^{\alpha} - \mathcal{R}_{y_{k+1}}^{\alpha} + C_{k+1}^{\alpha}(x_{k+1}^{\alpha+1} - x_{k+1}^{\alpha}) + D_{k+1}^{\alpha}(\lambda_{k+1}^{\alpha+1} - \lambda_{k+1}^{\alpha}) \quad (8.46) \quad \{\text{eq:mlcp2-NL}\}$$

with,

$$C_{k+1}^{\alpha} = \nabla_x h(t_{k+1}, x_{k+1}^{\alpha}, \lambda_{k+1}^{\alpha}) \quad (8.47)$$

$$D_{k+1}^{\alpha} = \nabla_{\lambda} h(t_{k+1}, x_{k+1}^{\alpha}, \lambda_{k+1}^{\alpha})$$

and

$$\mathcal{R}_{y_{k+1}}^{\alpha} \triangleq y_{k+1}^{\alpha} - h(x_{k+1}^{\alpha}, \lambda_{k+1}^{\alpha}) \quad (8.48)$$

**Newton's linearization of the third line of (8.35)** The same operation is performed with the third equation of (8.35)

$$\mathcal{R}_r(r, x, \lambda) = r - g(\lambda, t_{k+1}) = 0 \quad (8.49)$$

which is linearized as

$$\mathcal{R}_{L\lambda}(r_{k+1}^{\alpha+1}, x_{k+1}^{\alpha+1}, \lambda_{k+1}^{\alpha+1}) = \mathcal{R}_{rk+1}^{\alpha} + (r_{k+1}^{\alpha+1} - r_{k+1}^{\alpha}) - B_{k+1}^{\alpha}(\lambda_{k+1}^{\alpha+1} - \lambda_{k+1}^{\alpha}) = 0 \quad (8.50) \quad \{\text{eq:mlcp2-NLS}\}$$

$$r_{k+1}^{\alpha+1} = g(x_{k+1}^{\alpha}, \lambda_{k+1}^{\alpha}, t_{k+1}) - B_{k+1}^{\alpha}\lambda_{k+1}^{\alpha} + B_{k+1}^{\alpha}\lambda_{k+1}^{\alpha+1} \quad (8.51) \quad \{\text{eq:mlcp2-rr}\}$$

with,

$$B_{k+1}^{\alpha} = \nabla_{\lambda} g(x_{k+1}^{\alpha}, \lambda_{k+1}^{\alpha}, t_{k+1}) \quad (8.52)$$

and the residue for  $r$ :

$$\mathcal{R}_{rk+1}^{\alpha} = r_{k+1}^{\alpha} - g(\lambda_{k+1}^{\alpha}, t_{k+1}) \quad (8.53)$$

**Reduction to a linear relation between  $x_{k+1}^{\alpha+1}$  and  $\lambda_{k+1}^{\alpha+1}$**  Inserting (8.51) into (8.43), we get the following linear relation between  $x_{k+1}^{\alpha+1}$  and  $\lambda_{k+1}^{\alpha+1}$ ,

$$x_{k+1}^{\alpha+1} = h\gamma(W_{k+1}^\alpha)^{-1} \left[ g(x_{k+1}^\alpha, \lambda_{k+1}^\alpha, t_{k+1}) + B_{k+1}^\alpha (\lambda_{k+1}^{\alpha+1} - \lambda_{k+1}^\alpha) \right] + x_{free}^\alpha \quad (8.54)$$

that is

$$x_{k+1}^{\alpha+1} = x_p + h\gamma(W_{k+1}^\alpha)^{-1} B_{k+1}^\alpha \lambda_{k+1}^{\alpha+1} \quad (8.55)$$

with

$$x_p \triangleq h\gamma(W_{k+1}^\alpha)^{-1} \left[ g(x_{k+1}^\alpha, \lambda_{k+1}^\alpha, t_{k+1}) + -B_{k+1}^\alpha (\lambda_{k+1}^\alpha) \right] + x_{free}^\alpha \quad (8.56)$$

We get the linear relation

$$x_{k+1}^{\alpha+1} \triangleq x_p + \left[ h\gamma(W_{k+1}^\alpha)^{-1} B_{k+1}^\alpha \lambda_{k+1}^{\alpha+1} \right] \quad (8.57) \quad \{\text{eq:mlcp2-rfr}\}$$

**Reduction to a linear relation between  $y_{k+1}^{\alpha+1}$  and  $\lambda_{k+1}^{\alpha+1}$**  Inserting (8.57) into (8.46), we get the following linear relation between  $y_{k+1}^{\alpha+1}$  and  $\lambda_{k+1}^{\alpha+1}$ ,

$$y_{k+1}^{\alpha+1} = y_p + \left[ hC_{k+1}^\alpha (W_{k+1}^\alpha)^{-1} B_{k+1}^\alpha + D_{k+1}^\alpha \right] \lambda_{k+1}^{\alpha+1} \quad (8.58)$$

with

$$y_p = y_{k+1}^\alpha - \mathcal{R}_{y_{k+1}}^\alpha + C_{k+1}^\alpha(x_q) - D_{k+1}^\alpha \lambda_{k+1}^\alpha \quad (8.59)$$

$$x_q = x_p - x_{k+1}^\alpha \quad (8.60) \quad \{\text{eq:mlcp2-xq}\}$$

### 8.4.1 Time-discretization of the linear case (??)

Let us now proceed with the time discretization of (??) by a fully implicit scheme :

$$\begin{aligned} Mx_{k+1}^{\alpha+1} &= Mx_k + h\theta Ax_{k+1}^{\alpha+1} + h(1-\theta)Ax_k + h\gamma r_{k+1}^{\alpha+1} + h(1-\gamma)r(t_k) + hb \\ y_{k+1}^{\alpha+1} &= Cx_{k+1}^{\alpha+1} + D\lambda_{k+1}^{\alpha+1} + Fz + e \\ r_{k+1}^{\alpha+1} &= B\lambda_{k+1}^{\alpha+1} \end{aligned} \tag{8.61} \quad \{\text{eq:toto1-DS}\}$$

$$\begin{aligned} R_{free} &= M(x_{k+1}^{\alpha} - x_k) - h\theta Ax_{k+1}^{\alpha} - h(1-\theta)Ax_k - hb_{k+1} \\ R_{free} &= W(x_{k+1}^{\alpha} - x_k) - hAx_k - hb_{k+1} \end{aligned}$$

### 8.4.2 Resulting Newton step (only one step)

suppose:  $\gamma = 1$

$$\begin{aligned} (M - h\theta A)x_{k+1}^{\alpha+1} &= Mx_k + h(1-\theta)Ax_k + hr_{k+1}^{\alpha+1} + hb \\ y_{k+1}^{\alpha+1} &= Cx_{k+1}^{\alpha+1} + D\lambda_{k+1}^{\alpha+1} + Fz + e \\ r_{k+1}^{\alpha+1} &= B\lambda_{k+1}^{\alpha+1} \end{aligned} \tag{8.62}$$

that lead to with:  $(M - h\theta A) = W$

$$\begin{aligned} x_{k+1}^{\alpha+1} &= W^{-1}(Mx_k + h(1-\theta)Ax_k + r_{k+1}^{\alpha+1} + hb) = x_{free} + W^{-1}(r_{k+1}^{\alpha+1}) \\ y_{k+1}^{\alpha+1} &= (D + hCW^{-1}B)\lambda_{k+1}^{\alpha+1} + Fz + CW^{-1}(Mx_k + h(1-\theta)Ax_k + hb) + e \end{aligned} \tag{8.63}$$

with  $x_{free} = x_{k+1}^{\alpha} + W^{-1}(-R_{free}) = x_{k+1}^{\alpha} - W^{-1}(W(x_{k+1}^{\alpha} - x_k) - hAx_k - hb_{k+1}) = W^{-1}(Mx_k + h(1-\theta)Ax_k + hb_{k+1})$

$$\begin{aligned} y_{k+1}^{\alpha+1} &= (D + hCW^{-1}B)\lambda_{k+1}^{\alpha+1} + Fz + Cx_{free} + e \\ r_{k+1}^{\alpha+1} &= B\lambda_{k+1}^{\alpha+1} \end{aligned} \tag{8.64}$$

### 8.4.3 coherence with previous formulation

$$\begin{aligned} y_p &= y_{k+1}^{\alpha} - \mathcal{R}_{yk+1}^{\alpha} + C_{k+1}^{\alpha}(x_p - x_{k+1}^{\alpha}) - D_{k+1}^{\alpha}\lambda_{k+1}^{\alpha} \\ y_p &= Cx_k + D\lambda_k + C(\tilde{x}_{free}) - D\lambda_k + Fz + e \\ y_p &= Cx_k + C(\tilde{x}_{free}) + Fz + e \\ y_p &= Cx_k + C(\tilde{x}_{free}) + Fz + e \\ y_p &= C(x_{free}) + Fz + e \end{aligned}$$

## 8.5 Newton's linearization of (8.2) with (8.5)

$$\begin{aligned} Mx_{k+1} &= Mx_k + h\theta f(x_{k+1}, t_{k+1}) + h(1-\theta)f(x_k, t_k) + hr_{k+\gamma} \\ y_{k+\gamma} &= h(t_{k+\gamma}, x_{k+\gamma}, \lambda_{k+\gamma}) \\ r_{k+\gamma} &= g(\lambda_{k+\gamma}, t_{k+\gamma}) \end{aligned} \quad (8.65) \quad \{\text{eq:full-tot}\}$$

**Newton's linearization of the first line of (8.65)** The first line of the problem (??) can be written under the form of a residue  $\mathcal{R}$  depending only on  $x_{k+1}$  and  $r_{k+\gamma}$  such that

$$\mathcal{R}(x_{k+1}, r_{k+\gamma}) = 0 \quad (8.66) \quad \{\text{eq:full-NL3}\}$$

with  $\mathcal{R}(x, r) = M(x - x_k) - h\theta f(x, t_{k+1}) - h(1-\theta)f(x_k, t_k) - hr$  The solution of this system of nonlinear equations is sought as a limit of the sequence  $\{x_{k+1}^\alpha, r_{k+\gamma}^\alpha\}_{\alpha \in \mathbb{N}}$  such that

$$\begin{cases} x_{k+1}^0 = x_k \\ \mathcal{R}_L(x_{k+1}^{\alpha+1}, r_{k+\gamma}^{\alpha+1}) = \mathcal{R}(x_{k+1}^\alpha, r_{k+\gamma}^\alpha) + \left[ \nabla_x \mathcal{R}(x_{k+1}^\alpha, r_{k+\gamma}^\alpha) \right] (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) + \\ \quad \left[ \nabla_r \mathcal{R}(x_{k+1}^\alpha, r_{k+\gamma}^\alpha) \right] (r_{k+\gamma}^{\alpha+1} - r_{k+\gamma}^\alpha) = 0 \end{cases} \quad (8.67) \quad \{\text{eq:full-NL7}\}$$

### 8.5.1 Redaction note V. ACARY

What about  $r_{k+\gamma}^0$  ?

The residu free is also defined (useful for implementation only):

$$\mathcal{R}_{free}(x) \triangleq M(x - x_k) - h\theta f(x, t_{k+1}) - h(1-\theta)f(x_k, t_k),$$

which yields

$$\mathcal{R}(x, r) = \mathcal{R}_{free}(x) - hr.$$

$$\mathcal{R}(x_{k+1}^\alpha, r_{k+\gamma}^\alpha) = \boxed{\mathcal{R}_{k+1}^\alpha \triangleq \mathcal{R}_{free}(x_{k+1}^\alpha) - hr_{k+\gamma}^\alpha} \quad (8.68) \quad \{\text{eq:full-rfre}\}$$

$$\mathcal{R}_{free}(x_{k+1}^\alpha) = \boxed{\mathcal{R}_{freek+1}^\alpha \triangleq M(x_{k+1}^\alpha - x_k) - h\theta f(x_{k+1}^\alpha, t_{k+1}) - h(1-\theta)f(x_k, t_k)}$$

The computation of the Jacobian of  $\mathcal{R}$  with respect to  $x$ , denoted by  $W_{k+1}^\alpha$  leads to

$$W_{k+1}^\alpha \triangleq \nabla_x \mathcal{R}(x_{k+1}^\alpha) = M - h\theta \nabla_x f(x_{k+1}^\alpha, t_{k+1}). \quad (8.69) \quad \{\text{eq:full-NL9}\}$$

At each time-step, we have to solve the following linearized problem,

$$\mathcal{R}_{k+1}^\alpha + W_{k+1}^\alpha (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) - h(r_{k+\gamma}^{\alpha+1} - r_{k+\gamma}^\alpha) = 0, \quad (8.70) \quad \{\text{eq:full-NL10}\}$$

By using (8.68), we get

$$\mathcal{R}_{free}(x_{k+1}^\alpha) - hr_{k+\gamma}^{\alpha+1} + W_{k+1}^\alpha (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) = 0 \quad (8.71) \quad \{\text{eq:full-rfre}\}$$

$$\boxed{x_{k+1}^{\alpha+1} = h(W_{k+1}^\alpha)^{-1} r_{k+\gamma}^{\alpha+1} + x_{free}^\alpha} \quad (8.72)$$

with :

$$x_{free}^\alpha \triangleq x_{k+1}^\alpha - (W_{k+1}^\alpha)^{-1} \mathcal{R}_{freek+1}^\alpha \quad (8.73) \quad \{\text{eq:full-rfre}\}$$

The matrix  $W$  is clearly non singular for small  $h$ .

**Newton's linearization of the second line of (??)** The same operation is performed with the second equation of (??)

$$\mathcal{R}_y(x, y, \lambda) = y - h(t_{k+\gamma}, \gamma x + (1 - \gamma)x_k, \lambda) = 0 \quad (8.74)$$

which is linearized as

$$\begin{aligned} \mathcal{R}_{Ly}(x_{k+1}^{\alpha+1}, y_{k+\gamma}^{\alpha+1}, \lambda_{k+\gamma}^{\alpha+1}) &= \mathcal{R}_y(x_{k+1}^\alpha, y_{k+\gamma}^\alpha, \lambda_{k+\gamma}^\alpha) + (y_{k+\gamma}^{\alpha+1} - y_{k+\gamma}^\alpha) - \\ &\quad \gamma C_{k+1}^\alpha (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) - D_{k+\gamma}^\alpha (\lambda_{k+\gamma}^{\alpha+1} - \lambda_{k+\gamma}^\alpha) = 0 \end{aligned} \quad (8.75) \quad \{\text{eq:full-NL9}\}$$

This leads to the following linear equation

$$y_{k+\gamma}^{\alpha+1} = y_{k+\gamma}^\alpha - \mathcal{R}_{y,k+1}^\alpha + \gamma C_{k+1}^\alpha (x_{k+1}^{\alpha+1} - x_{k+1}^\alpha) + D_{k+\gamma}^\alpha (\lambda_{k+\gamma}^{\alpha+1} - \lambda_{k+\gamma}^\alpha). \quad (8.76) \quad \{\text{eq:full-NL11}\}$$

with,

$$C_{k+\gamma}^\alpha = \nabla_x h(t_{k+1}, x_{k+\gamma}^\alpha, \lambda_{k+\gamma}^\alpha) \quad (8.77)$$

$$D_{k+\gamma}^\alpha = \nabla_\lambda h(t_{k+1}, x_{k+\gamma}^\alpha, \lambda_{k+\gamma}^\alpha)$$

and

$$\mathcal{R}_{y,k+1}^\alpha \triangleq y_{k+\gamma}^\alpha - h(x_{k+\gamma}^\alpha, \lambda_{k+\gamma}^\alpha) \quad (8.78)$$

**Newton's linearization of the third line of (??)** The same operation is performed with the third equation of (??)

$$\mathcal{R}_r(r, \lambda) = r - g(\lambda, t_{k+1}) = 0 \quad (8.79)$$

which is linearized as

$$\mathcal{R}_{L\lambda}(r_{k+\gamma}^{\alpha+1}, \lambda_{k+\gamma}^{\alpha+1}) = \mathcal{R}_{r,k+\gamma}^\alpha + (r_{k+\gamma}^{\alpha+1} - r_{k+\gamma}^\alpha) - B_{k+\gamma}^\alpha (\lambda_{k+\gamma}^{\alpha+1} - \lambda_{k+\gamma}^\alpha) = 0 \quad (8.80) \quad \{\text{eq:full-NL9}\}$$

$$r_{k+\gamma}^{\alpha+1} = g(\lambda_{k+\gamma}^\alpha, t_{k+\gamma}) - B_{k+\gamma}^\alpha \lambda_{k+\gamma}^\alpha + B_{k+\gamma}^\alpha \lambda_{k+\gamma}^{\alpha+1} \quad (8.81) \quad \{\text{eq:full-rrL}\}$$

with,

$$B_{k+\gamma}^\alpha = \nabla_\lambda g(\lambda_{k+\gamma}^\alpha, t_{k+\gamma}) \quad (8.82)$$

and the residue for  $r$ :

$$\mathcal{R}_{r,k+\gamma}^\alpha = r_{k+\gamma}^\alpha - g(\lambda_{k+\gamma}^\alpha, t_{k+\gamma}) \quad (8.83)$$

**Reduction to a linear relation between  $x_{k+1}^{\alpha+1}$  and  $\lambda_{k+\gamma}^{\alpha+1}$**  Inserting (8.81) into (8.73), we get the following linear relation between  $x_{k+1}^{\alpha+1}$  and  $\lambda_{k+\gamma}^{\alpha+1}$ ,

$$x_{k+1}^{\alpha+1} = h(W_{k+1}^{\alpha})^{-1} \left[ g(\lambda_{k+\gamma}^{\alpha}, t_{k+\gamma}) + B_{k+\gamma}^{\alpha} (\lambda_{k+\gamma}^{\alpha+1} - \lambda_{k+\gamma}^{\alpha}) \right] + x_{free}^{\alpha} \quad (8.84)$$

that is

$$x_{k+1}^{\alpha+1} = x_p + h(W_{k+1}^{\alpha})^{-1} B_{k+\gamma}^{\alpha} \lambda_{k+\gamma}^{\alpha+1} \quad (8.85) \quad \{\text{eq:full-rfre}\}$$

with

$$x_p \triangleq h(W_{k+1}^{\alpha})^{-1} \left[ g(\lambda_{k+\gamma}^{\alpha}, t_{k+\gamma}) - B_{k+\gamma}^{\alpha} (\lambda_{k+\gamma}^{\alpha}) \right] + x_{free}^{\alpha} \quad (8.86)$$

**Reduction to a linear relation between  $y_{k+1}^{\alpha+1}$  and  $\lambda_{k+\gamma}^{\alpha+1}$**  Inserting (8.85) into (8.76), we get the following linear relation between  $y_{k+1}^{\alpha+1}$  and  $\lambda_{k+\gamma}^{\alpha+1}$ ,

$$y_{k+1}^{\alpha+1} = y_p + \left[ h\gamma C_{k+\gamma}^{\alpha} (W_{k+1}^{\alpha})^{-1} B_{k+1}^{\alpha} + D_{k+1}^{\alpha} \right] \lambda_{k+1}^{\alpha+1} \quad (8.87)$$

with

$$y_p = y_{k+1}^{\alpha} - \mathcal{R}_{y_{k+1}}^{\alpha} + \gamma C_{k+1}^{\alpha}(x_q) - D_{k+1}^{\alpha} \lambda_{k+1}^{\alpha} \quad (8.88)$$

that is

$$y_p = h(x_{k+\gamma}^{\alpha}, \lambda_{k+\gamma}^{\alpha}) + \gamma C_{k+1}^{\alpha}(x_q) - D_{k+1}^{\alpha} \lambda_{k+1}^{\alpha} \quad (8.89)$$

$$x_q = (x_p - x_{k+1}^{\alpha}) \quad (8.90) \quad \{\text{eq:full-xqq}\}$$

**The linear case**

$$\begin{aligned} y_p &= h(x_{k+\gamma}^{\alpha}, \lambda_{k+\gamma}^{\alpha}) + \gamma C_{k+1}^{\alpha}(x_q) - D_{k+1}^{\alpha} \lambda_{k+1}^{\alpha} \\ &= C_{k+1}^{\alpha} x_{k+\gamma}^{\alpha} + D_{k+1}^{\alpha} \lambda_{k+\gamma}^{\alpha} + \gamma C_{k+1}^{\alpha}(x_q) - D_{k+1}^{\alpha} \lambda_{k+1}^{\alpha} \\ &= C_{k+1}^{\alpha} (x_{k+\gamma}^{\alpha} + \gamma x_p - \gamma x_{k+1}^{\alpha}) \\ &= C_{k+1}^{\alpha} ((1 - \gamma)x_k + \gamma x_{free}) \text{ since } x_p = x_{free} \end{aligned} \quad (8.91)$$

**Implementation details** For the moment (Feb. 2011), we set  $x_q = (1 - \gamma)x_k + \gamma x_{free}$  in the linear case. The nonlinear case is not yet implemented since we need to change the management of `H_alpha` in Relation to be able to compute the mid-point values. things that remain to do

- implement the function `BlockVector compute_g(t, lambda)` and `SimpleVector compute_h(t, x, lambda)` which takes into account the values of the argument and return and vector
- remove temporary computation in Relation of `Xq, g_alpha` and `H_alpha`. This should be stored somewhere else. (in the node of the graph)

# Chapter 9

## NewtonEuler

This section is about the Newton-Euler equations:

### 9.0.1 The dynamical system

$$\begin{aligned} m\dot{V}(t) &= F_{ext} \\ I\dot{\Omega} + \Omega \wedge I\Omega &= M_{ext} \end{aligned} \tag{9.1} \quad \{\text{NE\_Dyn1}\}$$

Where  $V$  is the velocity of the center of mass and  $\Omega$  is the angular speed in the referential attached to the object.

### 9.0.2 The relation

$X$  is the position and the orientation, we don't focus on its representation.

$$\begin{aligned} Y &= H(X) \\ R &= G(X, \lambda) \end{aligned} \tag{9.2} \quad \{\text{Relation}\}$$

The first equation is derived:

$$\dot{Y} = C\dot{X} + \dot{H}$$

It exists an operator  $T$  :

$$T : \begin{pmatrix} V \\ \Omega \end{pmatrix} \rightarrow \dot{X}$$

Using  $T$  leads to :

$$\dot{Y} = CT \begin{pmatrix} V \\ \Omega \end{pmatrix} + \dot{H}$$

### 9.0.3 discretization $t_k \rightarrow t_{k+1}$ , and implementation in Siconos

The goal of this section is to describe the computation done in Siconos. The unknown are rename using the Siconos convention.

#### 9.0.3.a the unknowns

About the DS:

$$_v_k = \begin{pmatrix} V_k \\ \Omega_k \end{pmatrix}$$

And  $_q_k$  represent the system, usually it could be the coordinate of the center of mass and a representation of the orientation.

### 9.0.3.b explicit case

The dynamical system 11.2 leads to the system:

$$\begin{pmatrix} m & 0 \\ 0 & I \end{pmatrix} (\_v_{k+1} - \_v_k) = h\_Fl_k + {}^t(CT)h\lambda_{k+1} \quad (9.3)$$

With

$$\_Fl_k = \begin{pmatrix} Fext_k \\ Mext_k - \Omega_k \wedge I\Omega_k \end{pmatrix}$$

Using  $W = \begin{pmatrix} m & 0 \\ 0 & I \end{pmatrix}^{-1}$

$$\_v_{k+1} = W(h\_Fl_k) + W^t(CT)h\lambda_{k+1} + \_v_k$$

(9.4) {NE\_dis\_expli

This computation is done in Moreau::updateState, using:

$$\_ResiduFree_k = -h\_Fl_k$$

$$Xfree_k = -W\_ResiduFree_k + \_v_k$$

The relation 9.2 leads to the system:

$$\dot{Y}_{k+1} = CT\_v_{k+1} + \dot{H}_k$$

Substitute  $\_v_{k+1}$  using 9.4 leads:

$$\dot{Y}_{k+1} = CT[Wh\_Fl_k + hW^t(CT)\lambda_{k+1} + \_v_k] + \dot{H}_k = CT[hW^t(CT)\lambda_{k+1} + Xfree_k] + \dot{H}_k$$

Ones gets:

$$\dot{Y}_{k+1} = CTW^t(CT)(h\lambda_{k+1}) + CTXfree_k + \dot{H}_k$$

Solving the one step problem gives  $h\lambda_{k+1}$ , and from 9.4 we get  $\_v_{k+1}$ . At least,  $\_v_{k+1}$  is used to compute  $\_q_{k+1}$ , provided  $\_q_{k+1}$ .

### 9.0.4 Quaternion case

Working in 3D, we chose  $\_q = \begin{pmatrix} X_g \\ q \end{pmatrix}$ .  $X_g$  are the 3 coordinates of the center of mass, and  $q$  is a quaternion represented the orientation of solid. It means :

$$q_k(0, GM_0)q_k^c = (0, GM_k)$$

Where G is the center of mass, and M any point of the solid.

This section describes the  $T$  operator in this case. Computation using quaternion leads to the relation:

$$\dot{q} = \frac{1}{2}q(0, \Omega)$$

So using the matrix formulation:

$$\dot{q} = \frac{1}{2} \begin{pmatrix} q_0 & -q_1 & -q_2 & -q_3 \\ q_1 & q_0 & -q_3 & q_2 \\ q_2 & q_3 & q_0 & -q_1 \\ q_3 & -q_2 & -q_1 & q_0 \end{pmatrix} \begin{pmatrix} 0 \\ \Omega \end{pmatrix} = T_q \Omega$$

That lead to :

$$\dot{\_q} = \begin{pmatrix} I_3 & 0 \\ 0 & T_q \end{pmatrix} \begin{pmatrix} V \\ \Omega \end{pmatrix} = T \begin{pmatrix} V \\ \Omega \end{pmatrix} = T\_v$$

It is noteworthy that  $T$  must be updated at each step.

### 9.0.5 The Newton linearization applied to NewtonEuler formalisme

Let us define the residu:

$$\mathcal{R}_k(v, \lambda) = W(v - v_k) - hF_{ext} - {}^t(CT)\lambda \quad (9.5) \quad \{\text{eq:newton\_NE}\}$$

The linearized residu is:

$$\mathcal{R}_{L_k}(v, \lambda) = \mathcal{R}_k(v_k, \lambda_k) + W(v - v_k) - {}^t(CT)(\lambda - \lambda_k) \quad (9.6) \quad \{\text{eq:newton\_NE}\}$$

Let us define  $v_k^p$  and  $\lambda_k^p$  the current Newton iteration, initialized with  $v_k$  and  $\lambda_k$ . We are looking for  $v_k^{p+1}$  and  $\lambda_k^{p+1}$  such that  $\mathcal{R}_{L_k}(v_k^{p+1}, \lambda_k^{p+1}) = 0$ . That is:

$$0 = \mathcal{R}_k(v_k^p, \lambda_k^p) + W(v_k^{p+1} - v_k^p) - {}^t(CT)(\lambda_k^{p+1} - \lambda_k^p) \quad (9.7) \quad \{\text{eq:newton\_NE}\}$$

That leads to:

$$v_k^{p+1} = v_k^p + W^{-1}[-\mathcal{R}_k(v_k^p, \lambda_k^p) + {}^t(CT)(\lambda_k^{p+1} - \lambda_k^p)] \quad (9.8) \quad \{\text{eq:newton\_NE}\}$$

The NSLAW is:

$$\dot{y}_k^{p+1} = CT v_k^{p+1} \quad (9.9) \quad \{\text{eq:newton\_NE}\}$$

that leads to the OSNSP:

$$\dot{y}_k^{p+1} = (CT)W^{-1} {}^t(CT)\lambda_k^{p+1} + (CT)[v_k^p - (CT)^t(CT)\lambda_k^p - W^{-1}\mathcal{R}_k(v_k^p, \lambda_k^p)] \quad (9.10) \quad \{\text{eq:newton\_NE}\}$$

#### 9.0.5.a Siconos implementation

The expression:  $W(v_k^p - v_k) - hF_{ext}$  is saved in DS->residiFree.Moreau->computeResidu.

The expression:  $\mathcal{R}_k(v_k^p, \lambda_k^p) = W(v_k^p - v_k) - hF_{ext} + {}^t(CT)(\lambda_k^p)$  is saved in DS->workFree.

The expression:  $vfree = \dot{y}_k^p - W^{-1}residuFree$  is saved in DS->workFree. Moreau->computeFreeState.

The computation:  $\dot{y}_k^{p+1} = vfree + W^{-1}\lambda_k^{p+1}$  is done in OSI::updateState.

The OSNSP is :

$$\dot{y}_k^{p+1} = (CT)W^{-1} {}^t(CT)\lambda_k^{p+1} + (CT)vfree + nslaweffect \quad (9.11)$$

## Chapter 10

# NewtonEulerR: computation of $\nabla_q H$

### 10.0.6 Gradient computaion, case oif NewtonEuler with quaternion

In the section,  $q$  is the quaternion of the dynamical system.

Figure 10.1: Impact of one DS.

{figCase}

$\nabla_q h$  consist in computing  $P_c(\frac{q+\delta q}{\|q+\delta q\|}) - P_c(q)$ .

$$GP(q) = qG_0P_0^c q$$

$$\begin{aligned} GP(\frac{q+\delta q}{\|q+\delta q\|}) &= (q+\delta q)G_0P_0^c(q+\delta q)\frac{1}{\|q+\delta q\|^2} \\ &= (q+\delta q)^c q GP(q) q^c (q+\delta q) \frac{1}{\|q+\delta q\|^2} \\ &= (1,0,0,0) + \delta q^c q GP(q) (q^c q + q^c \delta q) \frac{1}{\|q+\delta q\|^2} \\ &= GP(q) + \delta q^c q GP(q) + GP(q) q^c \delta q + 0(\delta q)^2 \frac{1}{\|q+\delta q\|^2} \end{aligned}$$

So, because  $G$  is independant of  $q$ :

$$P\left(\frac{q + \delta q}{\|q + \delta q\|}\right) - P(q) = qGP\left(\frac{q + \delta q}{\|q + \delta q\|}\right) - GP(q) = \delta q {}^c qGP(q) + GP(q)q {}^c \delta q + 0(\delta q)^2 + GP(q)\frac{1}{\|q + \delta q\|^2}$$

For the directional derivation, we chose  $\delta q = \epsilon * (1, 0, 0, 0)$ . using a equivalent to  $\frac{1}{1+\epsilon}$

$$\lim_{\epsilon \rightarrow 0} \frac{P\left(\frac{q + \delta q}{\|q + \delta q\|}\right) - P(q)}{\epsilon} = {}^c qGP(q) + GP(q)q - 2q_i GP(q)$$

For the directional derivation, we chose  $\delta q = \epsilon * (0, 1, 0, 0) = \epsilon * e_i$

$$\lim_{\epsilon \rightarrow 0} \frac{P\left(\frac{q + \delta q}{\|q + \delta q\|}\right) - P(q)}{\epsilon} = e_i {}^c qGP(q) - GP(q)qe_i - 2q_i GP(q)$$

Application to the NewtonEulerRImpact:

$$\begin{aligned} H : \mathbb{R}^7 &\rightarrow \mathbb{R} \\ \nabla_q H &\in \mathcal{M}^{1,7} \\ \nabla_q H &= \begin{pmatrix} N_x \\ N_y \\ N_z \\ ({}^c qGP(q) + GP(q)q - 2q_0 GP(q)).N \\ (e_2 {}^c qGP(q) - GP(q)qe_2 - 2q_1 GP(q)).N \\ (e_3 {}^c qGP(q) - GP(q)qe_3 - 2q_2 GP(q)).N \\ (e_4 {}^c qGP(q) - GP(q)qe_4 - 2q_3 GP(q)).N \end{pmatrix} \end{aligned}$$

### 10.0.7 Ball case

It is the case where  $GP = -N$ : for  $e_2$ :

$$\begin{aligned} (0, 1, 0, 0).(q_0, -\underline{p}).(0, -N) &= \\ \left( \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} . \underline{p}, \begin{pmatrix} q_0 \\ 0 \\ 0 \end{pmatrix} - \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} * \underline{p} \right) . (0, -N) &= \\ \left( ?, -\underline{p}_x N - \left( \begin{pmatrix} q_0 \\ 0 \\ 0 \end{pmatrix} - \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} * \underline{p} \right) * N \right) &= \end{aligned}$$

and:

$$\begin{aligned} (0, -N).(q_0, \underline{p}).(0, 1, 0, 0) &= \\ (N.\underline{p}, -q_0 N - N * \underline{p}).(0, 1, 0, 0) &= \\ \left( ?, (N.\underline{p}) \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} + \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} * (q_0 N + N * \underline{p}) \right) &= \\ \left( ?, (N.\underline{p}) \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} + q_0 \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} * N + \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} * (N * \underline{p}) \right) & \end{aligned}$$

sub then and get the resulting vector.N:

$$\left[ -\underline{p}_x N - N.\underline{p} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} + () * N - \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} * (N * \underline{p}) \right] . N =$$

$$-\underline{p}_x - N_x N \cdot \underline{p} + 0 - \left( \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} * (N * \underline{p}) \right) \cdot N =$$

using  $a * (b * c) = b(a \cdot c) - c(a \cdot b)$  leads to

$$-q_1 - N_x N \cdot \underline{p} - (q_1 N - N_x \underline{p}) \cdot N =$$

$$-q_1 - N_x N \cdot \underline{p} - q_1 + N_x N \cdot \underline{p} = -2q_1$$

for  $e1 = (1, 0, 0, 0)$ :

$$(q_0, -\underline{p}) \cdot (0, -N) = (?, -q_0 N + \underline{p} * N)$$

$$(0, -N) \cdot (q_0, \underline{p}) = (?, -q_0 N - \underline{p} * N)$$

So

$$\nabla_q H = \begin{pmatrix} N_x \\ N_y \\ N_z \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}$$

### 10.0.8 Case NewtonLaw : using the local frame and momentum

$$\begin{pmatrix} m\dot{V} \\ I\dot{\omega} + \omega I \omega \end{pmatrix} = \begin{pmatrix} F_{ext} + R \\ M_{ext} + R * PG \end{pmatrix}$$

with  $*$  vectoriel product,  $R$  reaction in the globla frame.  $P$  the point of contact.  $r$  is the reaction in the local frame.  $M^t r = R$  with:

$$M^t = \begin{pmatrix} nx \\ ny \\ nz \end{pmatrix}$$

with :

$$\begin{pmatrix} R_x \\ R_y \\ R_z \end{pmatrix} * \begin{pmatrix} PG_x \\ PG_y \\ PG_z \end{pmatrix} = \begin{pmatrix} R_y PG_z - R_z PG_y \\ R_z PG_x - R_x PG_z \\ R_x PG_y - R_y PG_x \end{pmatrix}$$

we have :

$$\begin{pmatrix} R \\ R * PG \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & PG_z & -PG_y \\ -PG_z & 0 & PG_x \\ PG_y & -PG_x & 0 \end{pmatrix} \cdot R := N^t R = N^t M^t r$$

we want:

$$\begin{pmatrix} m\dot{V} \\ I\dot{\omega} + \omega I \omega \end{pmatrix} = jachq T^t r$$

So  $jachq^t = MN$

### 10.0.9 Case FC3D: using the local frame and momentum

$$\begin{pmatrix} m\dot{V} \\ I\dot{\Omega} + \Omega I \Omega \end{pmatrix} = \begin{pmatrix} F_{ext} + R \\ M_{ext_{R_{obj}}} + (R * PG)_{R_{obj}} \end{pmatrix}$$

with \* vectoriel product,  $R$  reaction in the globla frame.  $P$  the point of contact.  $r$  is the reaction in the local frame.  $M_{R_{obj}toR_{abs}} = M_{R_{abs}toR_{obj}}^t r = R$  with:

$$M_{R_C to R_{abs}} = \begin{pmatrix} nx & t_1x & t_2x \\ ny & t_1y & t_2y \\ nz & t_1z & t_2z \end{pmatrix}$$

we have :

$$\begin{aligned} \begin{pmatrix} R \\ (R * PG)_{R_{obj}} \end{pmatrix} &= \begin{pmatrix} I_3 \\ M_{R_{abs}toR_{obj}} N_{PG} \end{pmatrix} . R \\ &= \begin{pmatrix} I_3 \\ M_{R_{abs}toR_{obj}} N_{PG} \end{pmatrix} . M_{R_{obj}toR_{abs}} r \\ N_{PG} &= \begin{pmatrix} 0 & PG_z & -PG_y \\ -PG_z & 0 & PG_x \\ PG_y & -PG_x & 0 \end{pmatrix} \end{aligned}$$

that is:

$$\begin{pmatrix} m\dot{V} \\ I\dot{\Omega} + \Omega I \Omega \end{pmatrix} = \begin{pmatrix} M_{R_C to R_{abs}} \\ M_{R_{abs}toR_{obj}} N_{PG} M_{R_C to R_{abs}} \end{pmatrix} r$$

So  $jachqt = MN$

### 10.0.10 Case FC3D: using the local frame local velocities

Figure 10.2: Two objects colliding.

{figCase}

We are looking for an operator named  $CT$  such that:

$$V_C = \begin{pmatrix} V_N \\ V_T \\ V_S \end{pmatrix}_{R_C} = CT \begin{pmatrix} V_{G1} R_{abs} \\ \Omega_1 R_{obj1} \\ V_{G2} R_{abs} \\ \Omega_2 R_{obj2} \end{pmatrix}$$

$$V_C = V_{G1} R_{abs} + w_1 * G_1 P_{R_{abs}} - (V_{G2} R_{abs} + w_2 * G_1 P_{R_{abs}})$$

where  $w_1$  and  $w_2$  are given in  $R_{abs}$ . We note  $M_{R_{obj1}toR_{abs}}$  the matrice converting the object 1 coordinate to the absolute coordinate. We note  $N_{GP}$  the matrice such that  $w_1 * G_1 P_{R_{abs}} = N_{GC} w_1$ . Endly, we note  $M_{R_{abs}toR_C}$  converting the absolute coordinate to the  $R_C$  frame. we get:

$$CT = M_{R_{abs}toR_C} \begin{pmatrix} I_3 & N_{G1C} M_{R_{obj1}toR_{abs}} & -I_3 & -N_{G2C} M_{R_{obj2}toR_{abs}} \end{pmatrix}$$

#### 10.0.10.a Expression of $M_{R_{obj1}toR_{abs}}$

Using quaternion, we get :

$$M_{R_{obj1}toR_{abs}} = \begin{pmatrix} q \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} {}^c q & q \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} {}^c q & q \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} {}^c q \end{pmatrix}$$

#### 10.0.10.b Expression of $N_1$

$$N_{GC} = \begin{pmatrix} 0 & G_1 C_z & -G_1 C_y \\ -G_1 C_z & 0 & G_1 C_x \\ G_1 C_y & -G_1 C_x & 0 \end{pmatrix}$$

# Chapter 11

## Projection On constraints

### 11.0.11 Velocity formulation

The first step consists in doing a velocity formulation of the system:

$$\begin{aligned} M\dot{v} &= F_{ext} + B\lambda \\ \dot{q} &= Tv \\ y &= h(q) \\ NSLAW(y, \lambda, \dots) \end{aligned} \tag{11.1} \quad \{\text{NE\_Dyn1}\}$$

The constraint  $\dot{q} = Tv$  is sufficient to keep a normal quaternion. Because of the speed formulation,  $h(q)$  could violate the NSLAW. A solution could be to add a formulation in position. We must underline that the constraints  $|Q| = 1$  is implicit in this system. Indeed, the direction  $\dot{q} = Tv$  is tangential to the sphere.

### 11.0.12 Posion formulation

It consists in writting a position formulation on the systeme:

$$h(q) = \begin{pmatrix} HI(q) \\ HE(q) \end{pmatrix} \tag{11.2} \quad \{\text{NE\_Dyn1}\}$$

We are looking for  $q_1$  from  $q_0$ :

$$q_1 = q_0 + \nabla HI \Lambda_I + \nabla HE \Lambda_E \tag{11.3}$$

Assume that  $h(q_0)$  doesn't satisfy the constraints, ie  $HI(q_0) \not\geq 0$  or  $HE(q_0) \neq 0$ . Linearize  $h$  leads to:

$$0 \leq HI(q_0) + \nabla^t HI (\nabla HI \Lambda_I + \nabla HE \Lambda_E) \perp \Lambda_I \geq 0 \tag{11.4}$$

$$0 = HE(q_0) + \nabla^t HE (\nabla HI \Lambda_I + \nabla HE \Lambda_E) \tag{11.5}$$

The getting system could be written has a MLCP:

$$C \ni h(q_0) + \nabla^t (\nabla \Lambda), \Lambda \in C^* \tag{11.6}$$

In the case of a quaternion  $Q$  for the rotation representation, it is noteworthy that this system doesn't deal with the constraints  $|Q| = 1$ . Thus, the direction  $(q_1, q_0)$  can be normal to this constraint, in that case this approach doesn't work. (It happens in practice) The solution that consists in normaliaed q after this formulation is not convenient because, it could be incompatible with  $|Q| = 1$ . A better approach is to add this constraint.

### 11.0.13 Position formulation with the quaternion constraints

It consists in adding the constraint  $|Q| = 1$  in the system HE:

$$\tilde{H}E(q) = \begin{pmatrix} HE(q) \\ |Q| - 1 \end{pmatrix} \quad (11.7)$$

The formulation described above can be done.

## Chapter 12

# Simulation of a Cam Follower System

Main Contributors: *Mario di Bernardo, Gustavo Osorio, Stefania Santini*  
*University of Naples Federico II, Italy.*

The free body dynamics can be described by a linear second order system. An external input is considered acting directly on the follower. This input is a non linear forcing component coming from the valve. The follower motion is constrained to a phase space region bounded by the cam position. The non conservative Newton restitution law is used for the computation of the post impact velocity. The cam is assumed to be massive therefore only rotational displacement is allowed. Under these assumptions, the free body dynamics of the follower can be described by

$$\mu \frac{d^2 u(t)}{dt^2} + \zeta \frac{du(t)}{dt} + \kappa u(t) = f_v(t), \quad \text{if } u(t) > c(t). \quad (12.1) \quad \{\text{eq:sols}\}$$

where  $\mu$ ,  $\zeta$  and  $\kappa$  are constant parameters for the follower mass, friction viscous damping and spring stiffness respectively. The state of the follower is given by the position  $u(t)$  and velocity  $v(t) = \frac{du}{dt}$ . The external forcing is given by  $f_v(t)$ . The cam angular position determines  $c(t)$  that defines the holonomic (i.e. constraint only on the position) rheonomic (i.e. time varying) constraint. The dynamic behavior when impacts occurs (i.e.  $u(t) = c(t)$ ) is modelled via Newton's impact law that in this case is given by

$$v(t^+) = \frac{dc}{dt} - r \left( v(t^-) - \frac{dc}{dt} \right) = (1+r) \frac{dc}{dt} - rv(t^-), \quad \text{if } u(t) = c(t). \quad (12.2) \quad \{\text{eq:il}\}$$

where  $v(t^+)$  and  $v(t^-)$  are the post and pre impact velocities respectively,  $\frac{dc}{dt}$  is the velocity vector of the cam at the contact point with the follower, and  $r \in [0, 1]$  is the restitution coefficient to model from plastic to elastic impacts. In Figure 12.1 is presented the schematic diagram of the physical cam-follower system. In Figure 12.1.a for  $t = 0$ , 12.1.b for  $t = \beta$ , and 12.1.c the profile of the constraint position  $\delta c(t)$ , velocity  $\frac{dc}{dt}(t)$  and acceleration  $\frac{d^2c}{dt^2}(t)$ . It is possible to visualize the follower displacement as a function of the cam position. It is also important to notice that different types of cams and followers profiles are used in practical applications.

### 12.0.14 The cam-follower as a Lagrangian NSDS.

It is possible to completely describe the cam-follower system as a driven impact oscillator into the framework of *Lagrangian NSDS* using a translation in space. Setting  $\hat{u}(t) = u(t) - c(t)$  and  $\hat{v}(t) = v(t) - dc/dt$ , then equations (12.1) and (12.2) can be expressed as (the argument  $t$  will not be explicitly written)

$$\mu \frac{d^2 \hat{u}}{dt^2} + \zeta \frac{d\hat{u}}{dt} + \kappa \hat{u} = f_v - \left( \mu \frac{d^2 c}{dt^2} + \zeta \frac{dc}{dt} + \kappa c \right) \equiv \hat{f}, \quad \text{if } \hat{u} > 0. \quad (12.3) \quad \{\text{eq:trans}\}$$

$$\hat{v}^+ = -r\hat{v}^-, \quad \text{if } \hat{u} = 0. \quad (12.4)$$

Figure 12.1: Cam-Shaft's schematics. (a)  $t=0$ . (b)  $t=\beta$ . (c) Constraint position  $\delta c(t)$ , velocity  $\frac{d\delta c}{dt}(t)$  and acceleration  $\frac{d^2\delta c}{dt^2}(t)$ .

{Fig:cam-shaft}

Using the framework presented in [2] we have that the equation of motion of a Lagrangian system may be stated as follows :

$$M(q)\ddot{q} + Q(q, \dot{q}) + F(\dot{q}, q, t) = F_{ext}(t) + R \quad (12.5) \quad \{\text{eq:lag1}\}$$

From the (12.3) we can derive all of the terms which define a Lagrangian NSDS. In our case the model is completely linear:

$$\begin{aligned} q &= \begin{bmatrix} \hat{u} \\ \mu \end{bmatrix} \\ M(q) &= \begin{bmatrix} \mu \\ 0 \end{bmatrix} \\ Q(q, \dot{q}) &= \begin{bmatrix} 0 \\ 0 \end{bmatrix} \\ F(q, \dot{q}) &= \begin{bmatrix} \zeta \\ \kappa \end{bmatrix} \dot{q} + \begin{bmatrix} \zeta \\ \kappa \end{bmatrix} q \\ F_{ext} &= \begin{bmatrix} \hat{f} \end{bmatrix} \end{aligned} \quad (12.6) \quad \{\text{eq:lag2}\}$$

The unilateral constraint requires that:

$$\hat{u} \geq 0$$

so we can obtain

$$\begin{aligned} y &= H^T q + b \\ H^T &= \begin{bmatrix} 1 \end{bmatrix} \\ b &= 0 \end{aligned} \quad (12.7) \quad \{\text{eq:constr}\}$$

In the same way, the reaction force due to the constraint is written as follows:

$$R = H\lambda, \quad \text{with } H = \begin{bmatrix} 1 \end{bmatrix}$$

The unilateral contact law may be formulated as follow:

$$0 \leq y \perp \lambda \geq 0 \quad (12.8) \quad \{\text{eq:17}\}$$

and the Newton's impact law:

$$\text{If } y = 0, \dot{y}^+ = -r\dot{y}^- \quad (12.9) \quad \{\text{eq:17}\}$$

### 12.0.15 Implementation in the platform

For the simulation of the cam follower system follow the steps

1. Move to the working directory `sample/CamFollower`  
`$cd sample/CamFollower`
2. Clean the directory from binary files using the `siconos` command  
`$siconos -c`
3. Compile the file `CamFollowerNoXml.cpp` in the sample folder (See the code at the end of the section)  
`$siconos CamFollowerNoXml.cpp`
4. Change the simulation parameters (*i.e.* Follower initial position and velocity, cam initial angle, simulations time, cam rotational speed in rpm, etc.) in the file `CamFollowerNoXml.cpp`.

Next we present the sample code for the `CamFollowerNoXml.cpp` file:

```
int main(int argc, char* argv[]) {
    {
        // ===== Creation of the model =====
        // User-defined main parameters
        double rpm=358;
        double phi_0=0;
        unsigned int dsNumber = 1;    // the Follower and the ground
        unsigned int nDof = 1;        // degrees of freedom for the Follower
        double t0 = 0;                // initial computation time
        double T = 5;                 // final computation time
        double h = 0.0001;            // time step
        int Kplot;
        Kplot=(int)(Tplot/h);
        double position_init = 0.4;    // initial position for lowest bead.
        double velocity_init = 0.4;    // initial velocity for lowest bead.

        // ===== Dynamical systems =====

        vector<DynamicalSystem*> vectorDS; // the list of DS
        vectorDS.resize(dsNumber,NULL);

        SiconosMatrix *Mass, *K, *C; // mass/rigidity/viscosity
        Mass = new SiconosMatrix(nDof,nDof);
        (*Mass)(0,0) = 1.221;
        K = new SiconosMatrix(nDof,nDof);
        (*K)(0,0) = 1430.8;
        C = new SiconosMatrix(nDof,nDof);
        (*C)(0,0) = 0;

        // Initial positions and velocities
        vector<SimpleVector*> position_0;
        vector<SimpleVector*> velocity_0;
        position_0.resize(dsNumber,NULL);
        velocity_0.resize(dsNumber,NULL);
        position_0[0] = new SimpleVector(nDof);
        velocity_0[0] = new SimpleVector(nDof);
        (*(position_0[0]))(0) = position_init;
    }
}
```

```

(*velocity_0[0])(0) = velocity_init;

vectorDS[0] =
new LagrangianLinearTIDS(0,nDof,*(position_0[0]),*(velocity_0[0]),*Mass,*K,*C);

static_cast<LagrangianDS*>(vectorDS[0])
    ->setComputeFExtFunction("FollowerPlugin.so", "FollowerFExt");

// Example to set a list of parameters in FExt function.
// 1 - Create a simple vector that contains the required parameters.

// Here we set two parameters, the DS number.
SimpleVector * param = new SimpleVector(2);

(*param)(0)=rpm;
(*param)(1)=phi_0;
// 2 - Assign this param to the function FExt
static_cast<LagrangianDS*>(vectorDS[0])>setParametersListPtr(param,2);
// 2 corresponds to the position of FExt in the stl vector of possible parameters.
// 0 is mass, 1 Flnt.
// Now the cam rotational velocity in rpms will be available in FExt plugin.

### 12.0.16 Simulation

We have perform the simulation of the cam follower system for different values of the cam rotational speed with the SICONOS software package using a time-stepping numerical scheme with step size ( $h = 1e^{-4}$ ) and an event-driven scheme with minimum step size ( $h_{min} = 1e^{-12}$ ). Fig. 12.2 and 12.3 show the time simulations for different values of the cam rotational speed and Fig. 12.4 show the chaotic attractor at  $rpm = 660$  for impact and stroboscopic Poincarè sections.

Figure 12.2: Time series using SICONOS platform. Time-stepping scheme (continuous line). Event-driven scheme (dashed line) (a)  $rpm=358$ . (b)  $rpm=660$ . (c)  $rpm=700$ .

## Chapter 13

# Quartic Formulation

### 13.0.17 Slidding ?

It consists in finding  $\alpha > 0$  and  $R \in \partial K_\mu$  such that  $-\alpha \begin{pmatrix} 0 \\ R_T \end{pmatrix} = MR + q$ . That is :

$$\left[ M + \begin{pmatrix} 0 & 0 & 0 \\ 0 & \alpha & 0 \\ 0 & 0 & \alpha \end{pmatrix} \right] R + q = 0 \quad (13.1) \quad \{\text{eq\_quartic1}\}$$

#### 13.0.17.a $R_T$ is on a conic

The first line of the system 13.1 and the  $R \in \partial K_\mu$  is the intersection between a plan and a cone in  $\mathbb{R}^3$ , ended:

$$\begin{aligned} \mu R_N &= \| R_T \| \\ \frac{M_{11}}{\mu} \| R_T \| &= -q_1 - M_{12}R_{T1} - M_{13}R_{T2} \end{aligned} \quad (13.2) \quad \{\text{eq\_quartic2}\}$$

That is:

$$\begin{aligned} \mu^2 R_N^2 &= (R_{T1}^2 + R_{T2}^2) \\ \frac{M_{11}^2}{\mu^2} (R_{T1}^2 + R_{T2}^2) &= (-q_1 - M_{12}R_{T1} - M_{13}R_{T2})^2 \end{aligned} \quad (13.3) \quad \{\text{eq\_quartic2}\}$$

That means that  $R_T$  is contained in a conic, focus and directrice are:

$$\begin{aligned} \mathcal{D} : q_1 + M_{12}R_{T1} + M_{13}R_{T2} &= 0 \\ \text{focus} : \mathcal{O} \\ \frac{M_{11}^2}{\mu^2} \text{Dist}(\mathcal{O}, R_T)^2 &= \text{Dist}(\mathcal{D}, R_T)^2 (M_{12}^2 + M_{13}^2) \\ \frac{\text{Dist}(\mathcal{O}, R_T)}{\text{Dist}(\mathcal{D}, R_T)} &= \frac{\mu \sqrt{(M_{12}^2 + M_{13}^2)}}{M_{11}} = e \end{aligned} \quad (13.4) \quad \{\text{eq\_quartic3}\}$$

The parametric equation is:

$$\begin{aligned} R_{T1} &= r \cos(\theta) \\ R_{T2} &= r \sin(\theta) \\ r &= \frac{p}{1 + e \cos(\theta - \phi)} \end{aligned} \quad (13.5) \quad \{\text{eq\_quartic4}\}$$

With  $p$  an simple expression of  $M_{11}, M_{12}, M_{13}$ , and  $\phi$  a constant angle between  $\mathcal{D}$  and  $(O, R_{T1})$

#### 13.0.17.b The two last line of the system 13.1

$$\frac{\| R_T \|}{\mu} \tilde{M}_1 + \left( \tilde{M} + \begin{pmatrix} \alpha & 0 \\ 0 & \alpha \end{pmatrix} \right) R_T + \tilde{q} = 0 \quad (13.6) \quad \{\text{eq\_quartic5}\}$$

$\tilde{M}$  is symmetric, so it exists a unitary matrix  $V$  such that  $V\tilde{M}V^T = \begin{pmatrix} d_1 & 0 \\ 0 & d_2 \end{pmatrix}$ . One can get:

$$\frac{\|R_T\|}{\mu} V\tilde{M}_1 + V \left( \tilde{M} + \begin{pmatrix} \alpha & 0 \\ 0 & \alpha \end{pmatrix} \right) V^T V R_T + V\bar{q} = 0 \quad (13.7) \quad \{\text{eq\_quartic6}\}$$

Rename:

$$\frac{\|\bar{R}_T\|}{\mu} \bar{M}_1 + \begin{pmatrix} d_1 + \alpha & 0 \\ 0 & d_2 + \alpha \end{pmatrix} \bar{R}_T + \bar{q} = 0 \quad (13.8) \quad \{\text{eq\_quartic7}\}$$

In the plan, either  $V$  is a rotation or a symetrie. So  $\bar{R}_T = V R_T$  is a conic with the same focus and a rotated directrice, it means that it exists  $\phi_1$  such that :

$$\begin{aligned} \bar{R}_{T1} &= r \cos(\theta) \\ \bar{R}_{T2} &= r \sin(\theta) \\ r &= \frac{p}{1 + e \cos(\theta - \phi_1)} \end{aligned} \quad (13.9) \quad \{\text{eq\_quartic8}\}$$

The equation 13.8 is :

$$\begin{aligned} (d_1 + \alpha) \bar{R}_{T1} &= -\bar{q}_1 + a_1 \|R_T\| \\ (d_2 + \alpha) \bar{R}_{T2} &= -\bar{q}_2 + a_2 \|R_T\| \end{aligned} \quad (13.10) \quad \{\text{eq\_quartic9}\}$$

The case ( $\bar{R}_{T1} = 0$  or  $\bar{R}_{T2} = 0$ ) has to be examine. We try to eliminate  $\alpha$ :

$$\begin{aligned} d_1 \bar{R}_{T1} \bar{R}_{T2} + \alpha \bar{R}_{T1} \bar{R}_{T2} &= -\bar{q}_1 \bar{R}_{T2} + a_1 \bar{R}_{T2} \|R_T\| \\ d_2 \bar{R}_{T1} \bar{R}_{T2} + \alpha \bar{R}_{T1} \bar{R}_{T2} &= -\bar{q}_2 \bar{R}_{T1} + a_2 \bar{R}_{T1} \|R_T\| \end{aligned} \quad (13.11) \quad \{\text{eq\_quartic10}\}$$

that leads to:

$$(d_1 - d_2) \bar{R}_{T1} \bar{R}_{T2} = -\bar{q}_1 \bar{R}_{T2} + \bar{q}_2 \bar{R}_{T1} + (a_1 \bar{R}_{T2} - a_2 \bar{R}_{T1}) \|R_T\| \quad (13.12) \quad \{\text{eq\_quartic10}\}$$

The parametric expression of  $\bar{R}_T$  leads to:

$$\begin{aligned} (d_1 - d_2) r^2 \cos(\theta) \sin(\theta) &= -\bar{q}_1 r \sin(\theta) + \bar{q}_2 r \cos(\theta) + r(a_1 r \sin(\theta) - a_2 r \cos(\theta)) \\ \text{ie: } (d_1 - d_2) r \cos(\theta) \sin(\theta) &= -\bar{q}_1 \sin(\theta) + \bar{q}_2 \cos(\theta) + r(a_1 \sin(\theta) - a_2 \cos(\theta)) \end{aligned} \quad (13.13) \quad \{\text{eq\_quartic11}\}$$

with the expression of  $r$ :

$$\begin{aligned} (d_1 - d_2) \frac{p}{1 + e \cos(\theta - \phi_1)} \cos(\theta) \sin(\theta) &= \\ -\bar{q}_1 \sin(\theta) + \bar{q}_2 \cos(\theta) + \frac{p}{1 + e \cos(\theta - \phi_1)} (a_1 \sin(\theta) - a_2 \cos(\theta)) \end{aligned}$$

$$\begin{aligned} \text{ie: } (d_1 - d_2) p \cos(\theta) \sin(\theta) &= \\ (1 + e \cos(\theta - \phi_1)) (-\bar{q}_1 \sin(\theta) + \bar{q}_2 \cos(\theta)) + p(a_1 \sin(\theta) - a_2 \cos(\theta)) \end{aligned} \quad (13.14) \quad \{\text{eq\_quartic12}\}$$

$$\begin{aligned} \text{ie: } (d_1 - d_2) p \cos(\theta) \sin(\theta) &= \\ (1 + e(\cos(\theta) \cos(\phi_1) + \sin(\theta) \sin(\phi_1))) (-\bar{q}_1 \sin(\theta) + \bar{q}_2 \cos(\theta)) + p(a_1 \sin(\theta) - a_2 \cos(\theta)) \end{aligned}$$

$$\begin{aligned} \text{ie: } (d_1 - d_2) p \cos(\theta) \sin(\theta) &+ \\ (1 + e \cos(\theta) \cos(\phi_1) + e \sin(\theta) \sin(\phi_1)) (\bar{q}_1 \sin(\theta) - \bar{q}_2 \cos(\theta)) + p(-a_1 \sin(\theta) + a_2 \cos(\theta)) &= 0 \end{aligned}$$

rename :

$$A \cos(\theta)^2 + B \sin(\theta)^2 + C \sin(\theta) \cos(\theta) + D \sin(\theta) + E \cos(\theta) = 0 \quad (13.15) \quad \{\text{eq\_quartic13}\}$$

with

$$\begin{aligned} A &= -e \bar{q}_2 \cos(\phi_1) \\ B &= e \bar{q}_1 \sin(\phi_1) \\ C &= (d_1 - d_2) p + e \cos(\phi_1) \bar{q}_1 - e \sin(\phi_1) \bar{q}_2 \\ D &= \bar{q}_1 - p a_1 \\ E &= -\bar{q}_2 + p a_2 \end{aligned} \quad (13.16) \quad \{\text{eq\_quartic12}\}$$

rename : Using the following set of unknown :

$$\begin{aligned} t &= \tan(\theta/2) \\ \sin(\theta) &= \frac{2t}{1+t^2} \\ \cos(\theta) &= \frac{1-t^2}{1+t^2} \end{aligned} \quad (13.17) \quad \{\text{eq\_quartic14}\}$$

leads to:

$$\begin{aligned} &A \frac{(1-t^2)^2}{1+t^2} + B \frac{4t^2}{1+t^2} + C \frac{2t(1-t^2)}{1+t^2} + D2t + E(1-t^2) = 0 \\ \text{ie: } &A(1-t^2)^2 + 4Bt^2 + C2t(1-t^2) + 2Dt(1+t^2) + E(1-t^2)(1+t^2) = 0 \end{aligned} \quad (13.18) \quad \{\text{eq\_quartic13}\}$$

$$\text{ie: } P_4 = A - E \quad P_3 = -2C + 2D \quad P_2 = 4B - 2A \quad P_1 = 2C + 2D \quad P_0 = A + E$$

Finally, we get 4 possible values for  $R_T$ , checking the sign of  $\alpha$  and  $R_N$  selects the solutions.

### 13.0.17.c case $R_{T12} = 0$

From 13.10,  $R_{T1}$  leads to:

$$\begin{aligned} \| R_T \| &= |\bar{R}_{T2}| = \frac{\bar{q}_1}{a_1} \\ \bar{R}_T &= \begin{pmatrix} 0 \\ \pm \frac{\bar{q}_1}{a_1} \end{pmatrix} \end{aligned} \quad (13.19) \quad \{\text{eq\_quartic14}\}$$

From 13.10,  $R_{T2}$  leads to:

$$\begin{aligned} \| R_T \| &= |\bar{R}_{T1}| = \frac{\bar{q}_2}{a_2} \\ \bar{R}_T &= \begin{pmatrix} \pm \frac{\bar{q}_2}{a_2} \\ 0 \end{pmatrix} \end{aligned} \quad (13.20) \quad \{\text{eq\_quartic14}\}$$

From  $\bar{R}_T$ , we have to check the coherence with the equation 13.9. If it is on the conic, we compute  $R$ , and the sign condition of the equation 13.1 must be check.
